Windows
Server System

Microsoft

Your potential. Our passion.[™]

"Instead of putting out fires, we now focus on ways we can deploy new technologies that benefit our customer service."

Dave Chacon
Manager, Technical Services, PING

Microsoft Windows Server System makes it easier for golf club maker PING to manage the infrastructure serving their 400 end users. Here's how: By using Windows Server 2003 with Active Directory,^{*} PING now centrally manages all its servers, desktops, and end users from one location. This cut annual administrative time by 800 hours. Time that can now be spent developing new ways to support customers, partners, and employees. Software that's easier to manage is software that helps you do more with less. Get the full PING story at microsoft.com/wsystm

AT A GLANCE**Borland to Unveil Role-based Tools**

Borland Software Corp. this week will announce an integrated set of role-based application Ma-cycle management tools called the Core Software Delivery Platform, or SDP. Code-named Project Themes, SDP excludes customized tools for IT analysts, architects, developers and testers. The tool set includes technology from several Borland products.

Microsoft Hires CRM Executive

Microsoft Corp. has hired a former PeopleSoft Inc. executive to oversee its CRM software. Brad Wilson, PeopleSoft's former worldwide vice president of CRM marketing, this week takes over as general manager of Microsoft's Business Solutions operation. Microsoft's current CRM head, David Thacher, will still manage CRM development, while Wilson oversees strategy.

Sun to Outsource Internal IT to CSC

Sun Microsystems Inc. will outsource much of its internal IT operations to Computer Sciences Corp. under a five-year, \$360 million contract. Sun said it will save \$100 million over the term of the pact. Under the agreement, CSC assumes responsibility for provisioning all of Sun application development and support services and will manage Sun's internal business applications.

IBM Offers New IT Financing Plan

IBM is rolling out a new set of financing options aimed at increasing sales to small and midsize business customers by simplifying the financing process. Dubbed IBM Financing Advantage, the initiative extends several existing programs. IBM said that it deals worth up to \$300,000 can now be approved within an hour.

Linux Kernel to Adopt Server Virtualization

Support for Xen software will be added to kernel; timetable remains uncertain

BY CAROL SILVA

TECHNOLOGY

Support for open source software that provides server virtualization capabilities is due to be added to a future version of the Linux kernel, sources familiar with the technology said last week.

But although Andrew Morton, the maintainer of the Linus 2.6 kernel, confirmed at the OSDL Enterprise Linux Summit here that support for the Xen open-source virtualization software is "going to happen," he wasn't clear about the time frame. Morton said it won't be included in the 2.6.11 version that's due late this month. But, he added, Xen support might be built into one of the two subsequent releases of the kernel that are expected later in the year.

Much will depend on the stability of the code that is submitted to Morton, said a spokesman for Beaverton, Ore.-based Open Source Development Labs Inc., which hosted the summit.

Major contributors to Xen include Hewlett-Packard Co. and Intel Corp., said Ian Pratt, founder of the Xen project and a senior lecturer at the University of Cambridge Computer Laboratory in England, where the 3-year-old open-source project is based.

IBM employees who work at the company's Linux Technology Center have also contributed to the Xen project, an IBM spokesman said.

Like the leading commercial offering from EMC Corp.'s VMWare Inc. division, Xen can execute multiple virtual machines, each running its own operating system, on a single server — although the two products work differently from a technical standpoint.

To use Xen today, companies must download either a software patch or a prebuilt operating system kernel that includes the patch from the Xen project's Web site. Thus far, Xen has attracted interest from some hosting companies and "the sophisticated IT department which already is heavily into Linux," Pratt said.

Dan Kusnetzky, an analyst at IDC, views the need for users to install a kernel patch as a major inhibitor to Xen's adoption. Most corporate users get Linux from distributors such as Red Hat Inc. and Novell Inc., and if they patch the kernel, their systems will no longer be supported unless the vendors agree to accept the patch, he said.

Both Red Hat and Novell said last month that they plan to include server virtualization technology in their versions of the operating system

and that Xen is a contender [QuickLink #27942].

Mike Prince, a IO at Burlington, Vt.-based Factory Warehouse Corp. in Burlington, N.J., said he's less worried about Linux distributors than he is about application vendors, which can be "ficky about what they'll support."

All Linux users since 2004, Burlington Corp. plans to test Xen as part of an effort to consolidate underutilized development and test systems and possibly some application servers as well, Prince said. The only reason the retailer hasn't already experimented with Xen is that it didn't know about the project until the past month, he added.

Joe Poole, manager of technical support at Linux user Bosco's Department Stores LLC, said the Reading, Pa.-based retail chain is looking to consolidate its "lesser servers" this year. Bosco's is committed to open-source software and plans to experiment with Xen, Poole said. But it will

Xen 2.1

- » Restructured host code will make the Xen software "leaner."

- » Users will be able to balance loads by moving virtual machines between CPUs.

Xen 3.0

- » Support will be added for guest operating systems on symmetrical multiprocessors.

- » This software will run on x86 systems based on AMD's Duron chip or Intel's EMT64 technology.

face an evolutionary, at least for the time being. All but one of those "lesser servers" run Windows, and Xen doesn't currently support the Microsoft Corp. operating system. Xen is eventually expected to support Windows through virtualization extensions built into Intel's processors. Intel plans to add virtualization support to its Itanium and Pentium chips later this year and to its Xeon processor next year, a company spokesman said. ■ **52398**

Red Hat Users Aren't Racing to Use 2.6 Kernel, CEO Says

Red Hat Inc. CEO Matthew Sarafin spoke with Computerworld last month. Excerpts from the interview follow:

Did Novell's acquisition of SUSE Linux early last year cause you to make any changes? If it did not alter our approach, certainly, they're a well-capitalized competitor as a result of the Microsoft settlement [QuickLink #5047]. But we continue to focus on the most important thing about our company - customers.

When is Red Hat Enterprise Linux 4 due, and what are the most critical improvements?

ments for corporate users?

Mid-February. I don't think there

are going to be enterprise customers lined up because they

want the latest widget in RHEL.

4. It will be reinforcing in the areas of better security, better policy management to make sure that a systems administrator has less complexity to deal with in a very large, distributed environment to distribute security policies; better managementability, of course, the ability of an integrated kernel that will provide better support for ISVs and better throughput; [and] areas around multithreading.

Do you have any concerns

that Novell supported the 2.6 kernel first? They did - but you know, our customers are not in that race to be first. When you walk into a Morgan Stanley and an AOL, they want stability.

They want manageability. They don't want to have to argue issues about breaking binary compatibility.

Who do you view as your greatest competition? The same ones who have always been - the evil-headed ones. It's Sun and Microsoft.

- Carol Silva

Linux Kernel to Adopt Server Virtualization

Support for Xen software will be added to kernel; timetable remains uncertain

BY CAROL SLIWA
BURLINNAGA, CALIF.

SUPPORT for open-source software that provides server virtualization capabilities is due to be added to a future version of the Linux kernel, sources familiar with the technology said last week.

But although Andrew Morton, the maintainer of the Linux 2.6 kernel, confirmed at the OSDL Enterprise Linux Summit here that support for the Xen open-source virtualization software "is going to happen," he wasn't clear about the time frame. Morton said it won't be included in the 2.6.11 version that's due late this month. But, he added, Xen support might be built into one of the two subsequent releases of the kernel that are expected later in the year.

Much will depend on the stability of the code that is submitted to Morton, said a spokesman for Beaverton, Ore.-based Open Source Development Labs Inc., which hosted the summit.

Major contributors to Xen are both Hewlett-Packard Co. and Intel Corp., said Ian Pratt, founder of the Xen project and a senior lecturer at the University of Cambridge Computer Laboratory in England, where the 3-year-old open-source project is based.

IBM employees who work at the company's Linux Technology Center have also contributed to the Xen project, an IBM spokesman said.

Like the leading commercial offering from EMC Corp.'s VMware Inc. division, Xen can execute multiple virtual machines, each running its own operating system, on a single server — although the two products work differently from a technical standpoint.

and that Xeo is a contender [QuickLink S7794].

Mike Prince, CIO at Burlington Coat Factory Warehouse Corp. in Burlington, N.J., said he's less worried about Linux distributors than he is about application vendors, which can be "finicky about what they'll support."

A Linux user since 1999, Burlington Coat plans to test Xen as part of an effort to consolidate underutilized development and test systems and possibly some application servers as well, Prince said. The only reason the retailer hasn't already experimented with Xen is that it didn't know about the project until the past month, he added.

Joe Poole, manager of technical support at Linux user Bosco's Department Stores LLC, said the Reading, Pa.-based retail chain is looking to consolidate its "lesser servers" this year. Bosco's is committed to open-source software and plans to experiment with Xen, Poole said. But it will

face a problem, at least for the time being. All but one of those "lesser servers" run Windows, and Xen doesn't currently support the Microsoft Corp. operating system.

Xen is eventually expected to support Windows through virtualization extensions built into Intel's processors. Intel plans to add virtualization support to its Itanium and Pentium chips later this year and to its Xeon processor next year, a company spokesman said. © 52396

Q&A

Push for Web-based Health Records Launched

Duke University spearheads a series of pilot tests in the U.S. and Canada

BY HEATHER HAVENSTEIN

A nonprofit foundation that's aiming to bolster consumer adoption rates of electronic health records is launching pilot tests of the technology in Canada and the U.S.

The Health Record Network Foundation (HRN), a joint venture of Durham, N.C.-based Duke University's medical and business schools, this month disclosed plans to launch a pilot program with a Toronto-based health system to create a portal where patient health information would be accessible over the Internet.

Under the program, patient records will be stored on HRN servers. Patient approval would be required to store the records on the server and make them accessible to others. "Unless consumers are actively engaged, even if you build a network, it doesn't mean it will be used," said Brian Baum, HRN's CEO.

The venture is still evaluating content management and database technology to use in the system.

HRN is also finalizing plans for a statewide pilot program in Wyoming and is in discussions with other states.

Most efforts to extend the reach of electronic health records today focus on creating standards that link IT systems in physicians' offices, hospitals and insurance companies. For example, the U.S. Department of Health and Human Services and other organizations are hammering out standards for such a system.

'Health Care Internet'

In contrast, Baum said, HRN plans to build on the pilot projects to form a "health care Internet" where authorized physicians and other users can access the health care history of all patients in the system.

Information that would be

stored in the system could include a child's inoculation records, the health care history of an aging parent, prescription data and lab results, Baum said.

In Canada, HRN has teamed up with Sunnybrook and Women's College Health Sciences Centre to test the HRN model with about 100 patients.

The pilot program will add select elements of internal computerized patient records to the HRN portal that may need to be accessed by other

health care providers, said Sam Marashoff, vice president and CIO at the Toronto-based teaching hospital.

In Wyoming, a health subcommittee in the state legislature has approved a pilot project with HRN, and the state is now waiting for about \$1.75 million needed to fund the effort, said Anne Ladd, executive director of the Wyoming Healthcare Commission. Ladd said the program should be less expensive than other systems.

However, Ladd noted that some physicians and health plans in the state have ex-

pressed concerns about the accuracy and completeness of the data that would be stored in the portal.

In addition, the plan doesn't

overcome the privacy con-

Unless consumers are actively engaged, even if you build a network, it doesn't mean it will be used.

BRIAN BAUM, CEO, HEALTH RECORD NETWORK FOUNDATION

cerns that have long dogged efforts to build electronic medical records programs.

Sue Blevis, president of the Institute for Health Freedom, a Washington-based health research center, said that if consumers were demanding electronic health records, then everyone would already be equipped with a memory stick with their data stored on it.

"People intuitively understand health care is not like your banking information — the IRS and my boss know how much money I make," she said. "When you combine making it easier to get data with the current weak law, that is a recipe for invasion of privacy." □ 52307

Agent-based App Lets Housing Agency Adapt on the Fly

Improves ability to respond to tenants' changing needs

BY HEATHER HAVENSTEIN

Halfway through its Plan for Transformation, a \$1.6 billion effort to refurbish or rebuild 25,000 public housing units, the Chicago Housing Authority (CHA) is dealing with an unexpected wrinkle in its plans to relocate residents during the project.

CHA officials had planned to relocate residents to temporary housing once — on its own a massive logistical undertaking — but they have found that many residents need to move multiple times for unexpected reasons before work on their permanent homes is done.

To tackle this jolt and other fluctuating requirements, such as special needs for seniors and availability of housing units, the CHA has relied on its Tenant Relocation Services Application, a software system that uses agent technology from Agentis Software Inc., in Walnut Creek, Calif., to make real-time adjustments.

Agency officials said earlier this month that the application's return on investment has been far greater than expected.

Agent technology — distrib-

uted software components that can reassign processes to meet goals without human intervention — is a practical application born from research into artificial intelligence.

When business requirements change for the CHA during the project, the application can be modified incrementally to manage exception handling without expensive and time-consuming recoding efforts, said Barbara Banks, the agency's CIO. Banks said the agency was able to slash by 50% the budgeted cost of building and making changes to the application.

"This [project requires] a process that has never been done before, and it is constantly changing," Banks said. "We stay not necessarily un-

derstand all the requirements on the front end. There are not applications on shelves we can grab and use. We needed something that was flexible."

As part of the project, residents can move to a temporary public-housing unit or receive a voucher to live in private housing. If tenants are forced to move from the housing authority, the authority is responsible for finding new housing.

The latest version of the system, completed by agency developers in October, has eight modules of business processes to track and adjust to various relocation issues, such as provisioning appliances and providing security deposits and reimbursement for moving expenses, said Banks.

The Agentis Adaptive Enterprise Solution Suite has tools to break down a problem into a series of goals and plans to achieve those goals, said Matt Sweetnam, principal consultant at Agentis.

Thus, the software can adapt to provision appliances for tenants only under specific circumstances. For example, once a moving client's appliances reach a set age, the system can place an order with a vendor and schedule an installation. And the system can change those rules for specific appliances, such as setting a

three-year limit on a stove and five years on a dishwasher.

The suite used by the CHA includes developer tools to build agents by defining the conditions under which the plan can execute.

"The real power of agents is they can actually learn. And as they learn, they can self-modify the rules," said Navi Radjou, an analyst at Forrester Research Inc. "It goes well beyond the rigid rules-based systems, which offer you a limited set of alternatives."

Agentis and other vendors, such as VT Agents LLC and Whitestein Technologies AG, are maneuvering to capture the growing demand from high-level executives for more-adaptive enterprises, which can respond to changes in product development, supply chain problems or logistical challenges, Radjou said. □ 52246

This [project requires] a process that has never been done before, and it is constantly changing.

BARBARA BANKS, CIO, CHICAGO HOUSING AUTHORITY

How did 80% of information become 100% useless?

What if information could find its way in and ~~out~~ of databases, all on its very own? With the Adobe Intelligent Document Platform it's possible. When you combine the logic of XML and Adobe PDF, suddenly documents are smarter. Unstructured content ~~unifies~~ with structured data. And information intuitively ~~travels~~ where it's needed, safely and securely. It's simplicity at work.

The Intelligent Document Platform. Better by Adobe.

See how smarter documents are working for other companies at adobe.com/idp.

BRIEFS

Microsoft Launches Research Initiative

Following the European Commission's call for increased technology research, Microsoft Corp. said it's launching an initiative to invest in research centers in Europe. The EuroScience program was unveiled by Microsoft Chairman Bill Gates in Prague. The first research center, at the University of Trento in Italy, will focus on using computational tools for biological research.

Google Reports Sales, Profit Boosts

Google Inc. saw revenue and net income grow significantly in its fourth quarter. The search engine vendor said its ad sales continued to climb both on its own and on partners' Web sites.

GOOGLE INC. FOURTH QUARTER	
	REVENUE
Q4 '99	\$1.63B
Q4 '98	\$52.8M

CA Names CFO

Computer Associates International Inc., raided Dell Inc. to fill one of its last remaining management vacancies. The company hired former Dell Chief Accounting Officer Robert Davis as its new chief financial officer. Davis fills a spot left open after CA fired former CFO Eric Zar in October 2003 in an accounting scheme that resulted in improper recording of \$2.2 billion in revenue.

Microsoft Ships New Search Engine

Microsoft's Internet Explorer search engine is ready to take center stage at the MSN.com Web portal. The portal previously used search technology from rival Yahoo! Inc. The new MSN Search engine, in beta-test mode since November, lets users search Web sites as well as content from Microsoft's Encarta encyclopedia and MSN Music.

C ON THE MARK

HOT TECHNOLOGY TRENDS, NEW PRODUCT NEWS AND INDUSTRY GOSSIP BY MARK HALL

Databases Can't Handle RFID . . .

... data deluge that will soon rain down on IT. Kathleen Mitchell, CEO of CopperEye Ltd. in Bath, England, says that radio frequency identification technology will arrive everywhere all too soon and that IT will be asked to manage the data that tracks "a product from raw materials to its final configuration." A

recent Ford Motor Co. recall of about 250,000 trucks underscores the problem. A small fraction of the recalled trucks have a faulty cruise-control device. Had parts information from Ford's production lines been accessible, the company could have recalled only the trucks affected. "I'm betting Ford had the data in log files, but it was too expensive to keep it, so it was tossed out," says Richard Cramer, CopperEye's vice president of marketing and business development. He and Mitchell contend that the situation will only get worse with RFID, which will balloon the amount of data that's generated and make indexing the information in a relational database prohibitively expensive and all but impossible. Mitchell estimates that if Wal-Mart Stores Inc. logged

all of its inventory via RFID tags for a single day, it would reach 7 million terabytes of data. Gulp! Can your database swallow that? Didn't think so. So, what can you do when RFID data management hits your inbox? Consider CopperEye's yet-to-be-announced Project Greenwich software. Due in Q2, Greenwich indexes the flat files, or data logs, that will be fed RFID information. According to Cramer, the technology can easily index petabytes of data. "Most of the data you'll never need," he says. "But when you need it, you need it right now." Just ask Ford.

Start providing endpoint security . . .
... with a new service from Check Point Software Technologies Ltd. in Redwood City,

Calif. The Program Advisor service, which is being launched today as a component of Check Point's Integrity 6.0 software upgrade, provides a database of trusted applications that can be queried in real time when a computer launches a program for the first time. If the application is listed in the database, you'll know that it's not malware. Rich Weiss, director of endpoint product marketing at Check Point, doesn't pretend that the current list of 85,000 applications covers the entire universe of commercial software. But Program Advisor will relieve security administrators of having to determine whether a heretofore unknown application on a network is a potential threat. In addition to the new service, Integrity 6.0 now runs in Linux and Windows clusters, automatically screens executable code for malware and improves reporting to Check Point's SmartCenter management console. Pricing hadn't finalized as of our publication deadline. SmartCenter itself will be upgraded next month with a real-time data-collection engine that can process log data from a variety of security devices at the rate of 20,000 log events per second, Check Point said.

Appliance controls network access . . .
... by screening both the device and the user. Later this month, Verner Networks Inc. in Mountain View, Calif., will ship its EdgeWall 7000 appliance, which screens each computer logging onto a corporate

Verner's EdgeWall 7000, a firewall for your LAN.

network for security vulnerabilities, such as whether systems are up to date on software patches. The device also correlates user access rights with a centralized Lightweight Directory Access Protocol directory, says Bethany Meyer, vice president of marketing at Verner. The EdgeWall 7000 automatically enforces security policies by quarantining vulnerable devices until their deficiencies have been remediated. Each appliance can handle up to 1,000 end users and costs \$9,000. "Consider it a firewall for your LAN," Meyer says.

Collaborative online Wild World . . .

... to get tools that appeal to IT. A Wiki is an open-source collaboration environment that lets anyone post information on a Web site. However, most Wikis have primitive information-management tools. Palo Alto, Calif.-based start-up JotSpot Inc. intends to remedy the situation with an epoxymous hosted service that's due to be launched by midyear. JotSpot will offer a WYSIWYG editor, viewing-control capabilities, page-access rights and other features. JotSpot adds the concept of a form to Wikis so their authors can create pages that, for example, include dates for tracking information. "Most Wikis don't know what a date or number is," says JotSpot CEO Jon Kraus. "A Wiki just sees text as a string." JotSpot's technology also lets users attach any kind of file to a Wiki page and then index the text for search purposes, even within word-processing documents that are attached to the page. According to Kraus, JotSpot will likely cost \$3 per user per month. © 2000

Experts Warn That Some CAS Arrays Are at Risk

Point to security flaw in MDS hashing algorithm used for digital signatures

BY LUCAS MEARNS

SECURITY EXPERTS are warning against the use of a flawed hashing algorithm, MDS, for digital signatures to store data securely on increasingly popular content addressed storage (CAS) systems.

For instance, an official at the National Institute of Standards and Technology last week said IT managers have good reason to be concerned about security flaws in MDS. "It's pretty well known right now that it's just not up to what you need," said Elaine Barker, head of NIST's computer security division.

Barker said NIST has no plans to certify or recommend the MDS algorithm for government use.

The warnings come as more vendors unveil CAS systems to meet the need for disk-based backup of fixed data such as e-mail and medical images. Experts say that under specific circumstances, hackers could create files containing malicious data that could cause data loss or the dissemination of bad data.

Of the four major vendors of CAS storage, two of them — EMC Corp. and Archivas Inc. in Waltham, Mass. — use the MDS algorithm. The other two, Permagit Inc. in Cambridge, Mass., and Avamar Technologies Inc. in Irvine, Calif., do not. Archivas said it provides the option of using

another method of indexing, called the Secure Hash Algorithm-1.

Users of EMC and Archivas systems say they aren't concerned about the warnings.

"I believe that the possibility of a [problem] is so unlikely that it does not bother me," said John Halama, CIO at Boston-based CareGroup Inc., a hospital management company. "Thus far, we've been working with [the] Centerra [array] for more than a year without a single issue."

Curt Tilmes, a systems engineer at NASA's Goddard Space Flight Center in Greenbelt, Md., has been testing an Archivas Cluster CAS system for archiving satellite data about the earth's atmosphere for more than a year.

He said he feels it's secure because it's on a private net-

work with firewalls. "I suppose it wouldn't [burn] to use a more secure algorithm, but for my application, it wouldn't have an effect," Tilmes said.

Seeking Alternatives

Meanwhile, Sun Microsystems Inc.'s long-awaited CAS system, code-named Honeycomb, won't use the MDS algorithm because of security concerns, said Chris Woods, chief technology officer for Sun's storage practice. Woods would not say which algorithm the company will use to index stored objects.

Just over a week ago, Storage Technology Corp. announced plans to resell CAS technology from Permagit for an e-mail archival system. StorageTek shied away from systems using MDS because of questions about whether it is compliant with U.S. Securities and Exchange Commission regulations, according to Harvey Andrus, product

marketing manager for StorageTek's Lifecycle Fixed Content Manager.

An SEC spokesman would not say whether his agency is currently investigating possible security flaws in MDS.

"It really is time for [the industry] to stop using MDS," said Dan Kaminsky, a security consultant at Avaya Inc. in Basking Ridge, N.J. "MDS has been a deprecated hashing algorithm for almost a decade. The industry has changed to the algorithm, partially out of inertia, partially out of scarcity of computer power."

In a report last month, Kaminsky pointed out that an attack could be used to create two files with the same MDS hash, one with "safe" data and one with "malicious" data. If both files were saved to the same system, a so-called collision could result, leading to data loss or the dissemination of bad data, he said.

Mike Kilian, CTO at EMC's Centers division, contended that MDS flaws don't apply to Centers arrays because a piece of content is stored, a company can't change it.

"Centers from almost Day 1 has had multiple addressing

So, What Is CAS?

CAS SYSTEMS store metadata and data along with management policies to create an object that is quickly retrievable, no matter where it's stored on a network. See also: CAS, WORM (write once, read many) capabilities to ensure that once data is stored, it can't be overwritten, which satisfies several regulatory requirements.

schemes available to applications," Kilian said.

Kaminsky disagreed. "Cryptography tends to be a 'garbage algorithm in, garbage security' discipline," he said. "Let's say there's some appending custom metadata to the end of their files. Conceivably, the attack would exist ... as once two files have the same hash, you can append the same [identical] metadata to both of them and they'll still possess the same hash."

Archivas officials noted that its CAS device does not use the MDS hash key to name the file in the archive, the way EMC's product does. **82268**

As VoIP Matures, Payback Remains an Issue for Users

BY MATT HAMPTON

Voice-over-IP technology will again be the major focus of this week's VoiceCon conference, with an emphasis on finding VoIP applications that are beneficial to business users.

Network managers who were waiting to see if VoIP was mature enough have discovered that it is, said Fred Knight, general manager of VoiceCon 2005, which is taking place this week in Orlando. "So the next question is, 'What can I do with this technology to help business work?'

Showcasing companies where to look for a return on their investments in IP telephony is really at the core of VoiceCon's agenda, Knight added. About 4,000 attendees, 60% of them users, are expected at

the conference, which is sponsored by MediaLive International Inc.

Craig Hinckley, senior vice president of network architecture at Bank of America Corp. in Charlotte, N.C., said VoIP is "pretty much a foregone conclusion" for next-generation corporate networks. "The discussion used to be 'if VoIP,' and it is now 'when,'" he said.

Hinckley will deliver a keynote address at VoiceCon describing Bank of America's accomplished VoIP implementation, which is designed to put 180,000 users on IP phones from Cisco Systems Inc. over the next three years. Up to 50,000 users should come online this year, Hinckley said.

About 35 pilot projects involving 1,000 users are already

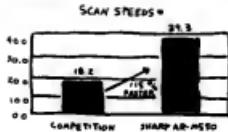

under way, he said. Much of the VoIP work is being coordinated by Electronic Data Systems Corp., which Bank of America hired in late 2002 to manage its networks under a 10-year, \$4.5-billion contract.

In his keynote, Hinckley will offer advice aimed at helping other IT managers move through the minefield of bringing voice and data teams together to build VoIP systems. "The first thing that happens when you mention you're doing VoIP is that the room splits the voice and data

► The discussion used to be 'if VoIP,' and it is now 'when.'

SCAN²

Double your productivity with Scan² technology.

The best way to stay ahead is to double your productivity. Introducing Scan² technology from Sharp. Sharp's Digital Imagers with Scan² technology are designed to scan two-sided documents in a single pass.

Now your training manuals and white papers can be scanned, copied, emailed and digitally distributed quicker than ever before.

In fact, it's 115% faster than any other product in its class. Not only is it like having double the help, it will also allow you to accomplish more tasks, in dramatically less time. Together with Sharp's integrated network management software and security features, your digital information is safe and workflow is fully optimized.

Visit sharpusa.com/scan2 or call 1-800-BE-SHARP for more information.

The AR-M50, AR-M620 and AR-M700

- Operate at 55, 62 and 70 pages per minute
- Fully integrated network ready digital copier/printers
- Include network management software and document filing capability

BRIEFS

Keane Wins \$14M Federal IT Deal

Keane Inc. has been awarded a new five-year, \$14 million services contract by Pavilion Benefit Guaranty Corp. The contract extends Keane's 10-year partnership with the federal agency. Under the agreement, the Boston-based consulting firm will provide a range of quality assurance services to manage the PRBC Integration and Testing Center and deliver verification and validation.

AOL Set to Ship New Browser

America Online Inc. next week plans to release its first public test version of a new Netscape browser that's designed to protect users from viruses and malicious code while surfing the Web. The Firefox-based browser targets Microsoft Corp.'s Internet Explorer, the subject of many security vulnerabilities, while taking advantage of the popularity of Firefox.

BT Group Extends Accenture Pact

BT Group PLC extended its human resources outsourcing deal with Accenture Ltd. by 10 years under a new \$576 million contract. The deal, which will begin in August, will cover HR and related IT functions for all of BT's 97,000 employees and 180,000 pensioners. The previous five-year contract covered only employees in the U.K.

IBM Buys Financial Outsourcer Equitant

IBM has agreed to acquire privately held Equitant, a Dublin-based financial IT outsourcing firm. Financial terms of the deal, which is expected to close in 30 days, were not disclosed. IBM said the move is aimed at strengthening its financial and administrative transformation services. All 200 Equitant employees will move over to IBM.

Feds Look to Finalize IT Security Controls

NIST issues last draft of new requirements

BY JAIRUMAR VILAYAN

THIS NATIONAL Institute of Standards and Technology (NIST) has released the final draft of a set of recommended security controls for federal information systems.

The controls are likely to become a mandatory and non-negotiable Federal Information Processing Standard by the end of this year for all federal information systems, except those related to national security.

Some analysts predicted that the mandatory controls will cause problems for agencies, especially smaller ones.

"It's OK to specify certain objectives. But it becomes hard if things are mandated down to the specific controls," said Michael Rasmussen, an analyst at Forrester Research Inc. "You can't apply a one-size-fits-all set of controls."

The third and final version of NIST's Special Publication

800-53 document incorporates several recommendations from people who commented on previously published versions, said Ross Rosa, project leader of NIST's Federal Information Security Management Act (FISMA) Implementation Project.

Passed in 2002, FISMA is the primary legislation covering the security of federal information systems.

Draft Changes

According to Ross, major changes in the final draft include a reduction in the number of security controls for low-impact systems, a new set of application-level controls and greater discretionary powers for organizations to downgrade controls.

Also included in the final draft is language that allows federal agencies to keep their existing security measures if they can demonstrate that the

level of security is equivalent to the standards being proposed by NIST.

Following a two-week public comment period, a final version of SP 800-53 is expected to be approved by the U.S. Commerce Department by the end of this month, Ross said.

Around June, NIST will publish a guide that federal agencies can use to assess the security measures they have put in

place, Ross added. "It will allow us to see if the controls they have implemented are producing the desired results," he said.

Adopting standards such as those proposed by NIST is crucial to the security of federal systems and to overall Internet security, said Larry Clinton, chief operating officer at the Internet Security Alliance (ISA) in Arlington, Va. But mandating compliance, even in the public sector, is a bad idea, he said.

ISA is a collaboration between the CERT Coordination Center at Carnegie Mellon University and the Electronic Industries Alliance, a federation of trade associations.

"The problem we're trying to solve changes far too quickly," Clinton said. "A traditional regulatory process just can't keep pace."

Except when dealing with classified information, there's little reason to apply mandatory controls to federal systems, added Bill Ozier, president of OFA Inc., a Vacaville, Calif.-based risk management consultancy. Controls should be applied based on "a quantitative risk assessment that anticipates the prospective loss," resulting from a cyberattack, Ozier said. © 2296

Draft Security Mandate

FISMA requires agencies to:
 • Ensure their information systems continue, maintain and improve their security.
 • Select and implement an information security program that includes a security strategy.
 • Establish a risk assessment based on assessment of high-value and high-risk assets.
 • Monitor the controls on a continual basis in order to gauge their effectiveness.

Hosted Apps Seek to Drive Auto Industry Collaboration

BY JAIRUMAR VILAYAN

Auto Web Communications Inc. this week plans to announce a hosted service that's designed to let companies in the auto industry more efficiently share product, project management and 3-D engineering data via the Internet.

The real-time collaboration service is based on product life-cycle management (PLM) software from Plano, Texas-based UGS Corp. and is being positioned as a lower-cost and less-complex alternative to implementing similar capabilities in-house.

The UGS software will allow companies to collaborate with one another using their

own project management and computer-aided design and engineering tools, said Nino DiCosimo, CEO of Rochester Hills, Mich.-based AutoWeb. The new service addresses "a definite need," especially for small and midsize companies, said Doug Halliday, director of engineering systems and data management at General Motors Corp.

"The ability to share product design information, fast and effectively, all over the planet as required is becoming key," Halliday said, noting that automakers such as GM and their major suppliers are moving to global development and product sourcing models.

GM is tying together its global development centers, joint-venture partners and large suppliers into a collaborative environment, Halliday said. The Teamcenter technology developed by UGS is playing a key role in that initiative.

Services such as those being offered by AutoWeb will help suppliers integrate systems more tightly with their own business partners, and with those of the manufacturing companies they supply to, Halliday said.

Reaching Out

AZ Automotive Corp. in Center Line, Mich., is one example of a company making such a change. AZ plans to sign up for AutoWeb's service in a bid to enable real-time product collaboration, initially among its nine North American

plants and eventually with its 100 or so suppliers worldwide, said Mark Henklein, the company's IT director.

"Being in a cost-reduction mode, we don't have a whole lot of capital to spend on software," he said. "AutoWeb gives us the ability to outsource the collaboration piece."

A key feature of Teamcenter is its support for the 3D IT data format, which enables data sharing among different systems, said Clark Grindstaff, executive vice president of product development at UGS.

AutoWeb is trying to tap into a growing interest in local PLM services, said Karen Annan, an analyst at CMData Inc. in Ann Arbor, Mich. The trend is prompting other business-to-business firms, such as Esystar and Eurostep, to roll out similar offerings, he added. © 2296

GLOBAL DISPATCHES

Study: China No Threat To India's Outsourcers

CHINA'S burgeoning economy and low wages have prompted speculation that it will soon be a strong competitor to India for IT outsourcing business. But a McKinsey & Co. study released last month concluded that it will be many years before China's software outsourcing industry is a threat to India's IT services juggernaut.

For starters, China's software services companies must consolidate their highly fragmented industry so they can gain the size and expertise needed to capture large international projects, consultants at New York-based McKinsey said.

Smaller companies are viewed as riskier partners that are vulnerable to the loss of key personnel and "may not have the financial muscle to survive for the duration of a project," the authors said. Yet, they added, the Chinese companies interviewed for the study showed little interest in mergers and acquisitions.

GLOBAL FACT

Right answer A report by Indian IT outsourcing firm Wipro Ltd. in the quarter ended Dec. 31, compared with the same period a year earlier.

An International IT News Digest

The study also found that only six of China's 30 largest software development companies are certified at Level 4 or 5 of the Software Engineering Institute's Capability Maturity Model. In contrast, all of the top 30 Indian software companies have achieved those rankings.

German Retailer Reports 99% RFID Read Rate

DUSCHENBACH, GERMANY BASED Metro AG, the world's third-largest retailer, reported Jan. 28 that it has successfully implemented radio frequency identification technology at its largest and busiest distribution center in Germany.

Metro has processed more than 50,000 shipping pallets equipped with RFID tags and is achieving 99% tag read rates, said Gerd Wolfgram, the executive project manager, in a prepared statement. The distribution center in Umla, Germany uses RFID readers and tags from Intermec Technologies Corp. in Everett, Wash.

Germany and the U.K. are the leading growth markets for RFID in Western Europe, where widespread adoption is expected in 2006 and 2007 after technical issues have been resolved and pilot projects have been completed, according to Juniper Research Ltd. in Hampshire, England. Juniper said it expects RFID to be a \$1 billion market in Western Europe by 2007.

Tokyo Court Orders Word Rival Off Market

TOKYO

YOKOHAMA DISTRICT COURT JUDGE last week ordered a halt to the production and sale of a popular word-processing program that is the only serious competitor to Japan to Microsoft Word. The court also called for existing stocks of the programs, called Ichitaro, to be destroyed on the grounds that it's Help Mode function infringes on a patent held by Matsushita Electric Industrial Co.

Jastystem Corp., the Tokushima, Japan-based vendor of Ichitaro, said it plans to appeal to a higher court. The company can continue selling the product until the higher court rules. Osaka, Japan-based Matsushita said it obtained a patent on the help function in 1998. **© 52347**

IT Role in Sarb-Ox Problems Is Unclear

Users find multiple compliance hurdles

BY THOMAS HOFFMAN

Audit and compliance experts last week offered mixed views as to how frequently IT-related deficiencies are a significant issue for those companies having problems meeting the requirements of the Sarbanes-Oxley Act of 2002.

Under Section 404 of Sarbanes-Oxley, publicly held companies are required to attest to their internal financial controls. Expert estimates range from a low of 5% to between 20% and 25% of the 4,000 companies filing reports this year will reveal "material weaknesses" in their financial controls.

Moreover, some experts predict that more than 200 publicly held companies will

disclose material weaknesses this year because of IT-related control deficiencies, such as security gaps and segregation among applications.

Todd Naughton, vice president and controller at Zebra Technologies Corp., said the toughest part of his company's internal controls assessment was in its IT operations. That's largely because of the amount of testing needed.

The Vernon Hill, Ill.-based supplier of printer components doesn't expect to identify any material weaknesses with its financial controls when it completes its assessment this week, Naughton said.

Meanwhile, officials at SunTrust Banks Inc., Eastman Kodak Co., Financial Institutions

Inc. and Ceridian Corp. each said the material weaknesses they have disclosed in financial controls weren't related to IT.

Many clients of Metis Group Inc. "were keeping their fingers crossed that the auditors weren't going to dig as deep in Year 1 around all of the IT areas," said John Van Decker, an analyst at the research firm in Stamford, Conn.

Van Decker expects that up to 25% of accelerated filers — companies with a market capitalization greater than \$75 million whose fiscal year ended after Nov. 15 — will report material weaknesses to their internal controls. The cause for 30% to 40% of those companies will be IT or application-control deficiencies.

Van Decker and other experts predicted that problems

will be more common among small-to-midsize businesses — those with \$75 million to \$900 million in revenues — whose IT staffs are stretched too thin to effectively deal with compliance requirements.

According to "Compliance Week," a Newton, Mass.-based weekly newsletter on corporate governance and compliance, only 35% of the 982 companies that made material weakness and "significant deficiency" disclosures in 2004

IT System Snags

Of the 502 "material weakness" and "significant deficiency" disclosures made in 2004, just 3.5% specifically mentioned IT controls, according to "Compliance Week," a weekly newsletter on corporate governance and compliance.

specifically mentioned IT controls.

However, those figures may be deceiving because the largest number of deficiency and weakness disclosures made in 2004 were related to financial systems and procedures, said "Compliance Week" Editor and Publisher Scott Cohen. "Companies don't always disclose granular details about such weaknesses, so it's possible that many did include problems with IT systems and controls," he said.

Marios Damilandes, a partner in the technology and security risk services group at Ernst & Young LLP in New York, expects that just 9% of accelerated filers will report material weaknesses in their internal controls. Within that subset, just one out of five companies will report IT-related deficiencies, predicted Damilandes. **© 52362**

Arkansas

the cost of AASIS at \$60 million, twice the estimated budget at the project's start. It contracted with SAP for the system in February 2000.

After the initial installation of SAP's budgeting system failed, the state spent \$2 million on software from Protech Solutions Inc. in Little Rock, Ark., according to officials. A source within the government said that the state will retire the performance-based component developed by Protech while keeping its basic budgeting application.

SAP insists that AASIS is a success overall and claims that the system has the support of the governor. "We delivered a tool for budgeting for the state, and they chose not to use it early on," said William Wohl, a spokesman for SAP America Inc. As for the litigation, he added, "the position the state took is not SAP's."

Arkansas Attorney General Mike Beebe, who is representing the state in its lawsuit against SAP, said the technology behind the performance-based budgeting software in AASIS was originally designed to provide individual agencies with more budgeting freedom while ensuring that they hit operational targets.

"The business model of budgeting traditionally uses line items," said Beebe. "This

SAP agrees to provide Arkansas with an ERP system that includes HR, payroll and performance-based budgeting.

Partially because of AASIS problems, the state's CIO resigns.

State discloses plans to upgrade the performance-based budgeting system.

2000	2001	2002	2004	2005
------	------	------	------	------

ERP system goes live without adequate performance-based budgeting or access for visually impaired users.

The state is sued by employees for a lack of handicapped access in AASIS; the state in turn sues SAP Public Services Inc.

grants more flexibility to agencies but has a risk and rewards system [that's] dependent on meeting goals and mission compliance."

The most recent version of the lawsuit, filed last February, states that "SAP's first attempt to deliver a budgeting system within AASIS as required by the contract wasn't complete when SAP unilaterally changed course. SAP's second attempt to provide a budget system 'outside' the integrated system on a business warehouse platform also failed."

Other Woes

In addition, because AASIS didn't comply with handicapped-accessibility requirements, a court shut down some non-essential portions of the system last July, Beebe said.

At times in the past several years, he said, some legislators

have discussed unplugging the entire system, though that rhetoric has died down lately.

"We could end up with an-

other vendor if they can't provide the software in our satisfaction," Beebe speculated. "My personal opinion is that

AASIS should provide what was contracted for."

He added that if SAP can't fix the budgeting application and meet the handicapped-accessibility requirements, "they should pay the amount necessary for another vendor."

Beebe said the state is still preparing for a trial in its lawsuit against SAP. No trial date has yet been set, he added.

The governor's spokesman declined to disclose the amount of damages that the state is seeking from SAP.

Beebe noted that in general, SAP blames the problems on a lack of adequate training and resources from the state, while Arkansas blames the performance of the software. © 52992

Sun

the unused CPU hours on the exchange.

Trading won't begin for another three to six months, a Sun official said, adding that the company may also offer CPU cycles on the exchange.

Sun said it is in a "proof of concept" phase on Sun Grid with some users and has about 10,000 CPUs available at multiple data centers. The base price for CPU time is \$1 per hour, and Sun is also offering storage at a monthly cost of \$1 per gigabyte. But volume users will likely pay a lower rate, the company said.

Subscription Interest

One user who plans to evaluate the Sun Grid model is Joe Euteneur, chief financial officer at XM Satellite Radio Holdings Inc. in Washington. XM last week said it has made Sun the sole Unix server and storage supplier for its back-office data center, which supports business operations, marketing and customer service. The company's broadcast operations use a variety of vendors, including Sun.

"They clearly have my interest," Euteneur said. "The computer industry is trying to move toward a subscription-

based business, and obviously we are a subscription-based business."

He added that he sees potential cost advantages to using Sun Grid, but it depends on the service delivery and the actual pricing that XM could get from Sun.

Sun expects the early adopters of Sun Grid in the high-performance computing users in industries such as financial services, oil and gas exploration, and life sciences.

Jonathan Schwartz, Sun's president and chief operating officer, said at the company's quarterly product rollout in Santa Clara, Calif., that large software development organizations also may find Sun Grid appealing.

The new approach "will offer standardized software infrastructure in a grid that all their developers can get access to worldwide, without that business having to maintain and operate the infrastructure," Schwartz said.

Other vendors, such as IBM, already offer pay-per-use utility computing. But Sun's fixed price and its marketplace approach illustrate the increase

in commoditization of IT, said Nicholas Carr, author of *Does IT Matter? Information Technology and the Corrosion of Competitive Advantage* (Harvard Business School Press, 2004).

Carr said that upward of 90% of a company's IT spending goes to basic infrastructure. "That's a large percent of expenditures that, in fact, can move to a utility model," he said. "I think [Sun Chairman and CEO] Scott McNealy has seen the future. The question now is, Have Scott McNealy's customers seen the future?"

Christopher Willard, an analyst at Framingham, Mass.-based IDC, said the technical users that Sun sees as likely Sun Grid customers have "an insatiable appetite" for compute cycles. But they will have to be convinced that security is tight and that data can be processed swiftly on the grid, he said. © 52993

CEO Says SAP Is Ready for New Oracle

BY JOHN BLAU
SAP AG plans by 2007 to roll out a new application platform based on its NetWeaver integration technology. The Business Process Platform will lead to an "industrialization of the software industry," contends CEO Hasso Plattner, who recently discussed the company's plans.

NetWeaver was introduced two years ago. How would you describe it? NetWeaver is an integration platform. We have integrated many technical tools into it so that customers can integrate legacy systems with SAP technology more easily. The idea is to give people on the outside access to functions inside our technology.

You're still rolling out NetWeaver, but you're already talking about the Business Process Platform. Why? We could stop with NetWeaver, but if customers want to adapt more quickly to new business models and be more innovative with their use of business software, they also need to be able to build new services faster and with greater flexibility. We want to create reusable processes at the application level and combine these with NetWeaver.

Will the new system be based on an open architecture? Definitely. We let customers decide in which language they want to develop add-ons. The discussion about whether it has to be [Java or our own ABAP (programming language)] is stupid.

When will Business Process Platform ship? In 2006, we will provide ISVs with broad access to the platform so they can develop software applications on top of it. We aim to move our complete portfolio to the [system] by 2007.

Will the new platform help differentiate SAP from Oracle? We be-

lieve so. We've been saying all along that the underlying technology, such as database systems, is a commodity and that

it makes no sense to integrate our software in this layer. We want to give customers the freedom to choose. Oracle still

believes everything revolves around data. We say everything revolves around processes.

What about price pressure, especially in the wake of the Oracle/PeopleSoft deal? I'm not sure

what will happen. We could see stable prices, but this depends on how determined Oracle is to gain market share. © 52351

DON TENNANT

The Three Stooges

WHEN I HEARD last week that three U.S. congressmen were raising the alarm that the planned sale of IBM's PC business to China's Lenovo Group could threaten our national security, all I could do was shake my head in disgust and think, "Here we go again."

In case you haven't heard, the three congressmen — the chairman of the House International Relations, Armed Services and Small Business committees — are fretting that advanced technology could be transferred to the Chinese government, and they want to roll out some bureaucratic red tape to slow down the government's review of the deal [QuickLink S2217]. The hand-wringing bespeaks a level of ignorance that has been pervasive in the U.S. Congress and media for years.

I lived in Hong Kong in the '90s, and I was there when the territory reverted to Chinese sovereignty on July 1, 1997. I was among the many Americans who were mortified by the cries of hysteria that were coming out of Congress — and by the way the event was covered in the U.S. media. I remember watching Dan Rather in that absurd flak jacket, reporting at midnight from the Hong Kong-China border. The backdrop was a convoy of trucks full of People's Liberation Army soldiers rumbling ominously into Hong Kong.

You would have thought Hong Kong was under siege. Never mind that any country that gains sovereignty over a territory is responsible for defending the citizens of that territory, and that China was obligated to be prepared to do that immediately. Never mind that I never once — not once — saw a PLA soldier during the two and a half years that I continued to live in Hong Kong after the transfer. Never mind that the trans-

fer was so transparent that the only perceptible change was the appearance of Chinese flags where the British flags used to be. Now we have Congressmen Larry, Moe and Curly running around making the same ill-informed, alarmist arguments that the opponents of Most Favored Nation trading status for China made in the '90s. And they appear to have an equally ill-informed, receptive audience. The New York Times, citing unnamed sources, reported that members of the Committee on Foreign Investments in the United States — the multilateral body reviewing the Lenovo deal — are concerned that things like battery technology could be used

to advance China's military capabilities. I'm not making that up.

The underlying problem, you see, is that China engages in industrial espionage against the U.S. Good grief. Don't tell anybody, but so do Japan, South Korea, France, Germany and just about all of our allies and largest trading partners. And... shhhhhh... we do it to them, too. Apparently that news is in some circles in Washington. And we're afraid about our R&D work being transferred to Beijing? Please. Many U.S. high-tech companies have long-standing R&D operations in China, IBM and Microsoft being among the largest. I've been to the facilities of both, and to some others. They're impressive, and they play an integral part in advancing the technologies that benefit people around the globe every day. That's the world we live in.

We're not living in a black-and-white world of 1930s isolationism. The Three Stooges are poking our third-largest trading partner in the eye, and it's inexcusable. If we put anything under review in Washington, let's make it legislative buffoonery. We'd all be better off. © 2219

MICHAEL H. HUGOS

The View From Jo'burg

LAST FALL, I made my way from Chicago to Frankfurt and then on to Johannesburg, South Africa, to speak at an IT conference. I experienced firsthand how information and communication technology (or ICT, as the Europeans and Africans say) is changing the world and driving the global economy [QuickLink S229]. My trip to Jo'burg (as the locals call it) was a life-changing experience for me.

In the past five years, the global information infrastructure has become a reality. It's odd, because we nearly tanked ourselves to death about all this during the boom years of the '90s, and when the bubble burst, we didn't want to hear about it anymore. But it happened anyway. Some of the wildest stock price inflation claims from the late '90s are now a reality or an imminent possibility. This is happening all over the world, not just in North America.

The theme of the three-day conference was "Getting the Most Out of Your IT Department." Topics included best practices for data security, measuring total cost of IT ownership and business growth strategies. My simple Chicago crew were challenged to understand English spoken with so many different accents — Indian, Afrikaans, Zulu, British. But I quickly realized that the presentations were every bit as substantive and advanced as anything I've heard in the States.

What was I expecting? Well, perhaps I was a bit of a Yankee IT elitist when I arrived, but that attitude was corrected in the face of overwhelming evidence. For most of the past 50 years, IT was largely driven by American inventiveness and entrepreneurship. U.S. companies are still major players, but IT is now a global industry, and many other countries have developed top-notch talent.

The U.S. no longer has a monopoly

on IT, and that takes some getting used to. But when you do get used to it, you start to realize that this spread of technology is making the world a better place. It is revitalizing and energizing the economy of South Africa, and the rest of the world, too.

One evening I had dinner with two other speakers from the conference. We went to an outdoor restaurant overlooking Nelson Mandela Square. Summer was coming on in the Southern Hemisphere, and the restaurants that lined the square were filled with people. My companions were South Africans of Indian and Afrikaner descent, respectively. We talked about all sorts of things, from the changes that South Africa has gone through in the past 10 years to the political and economic evolution that has made that possible. And we talked about how the build-out of data and telecom networks by South African companies is starting to drive economic growth in much of the rest of Africa.

We came from very diverse backgrounds, yet our common experiences with IT and our thoughts on how IT will shape the future gave us reason to be together. IT and telecommunications are the world's economy today what steel and railroads were at the start of the 20th century. They are the foundation upon which all sorts of other businesses can grow and thrive. There is something about a beautiful, warm African night and the company of people of goodwill that gives you the feeling that great things can happen. I am proud to be a part of it. 

DAN GILLMOR

Apple Suit Is Wrong Kind Of Different

WHEN Steve Jobs took the stage at the recent Macworld Conference and Expo in San Francisco to make his keynote speech, suspense was thick in the cavernous hall. But it wasn't the standard "What will he announce?" brand of suspense that has sparked Apple Computer's recent events of this kind.

What made it different was that the previous week, Apple had sliced lawyers against one of the most popu-

lar Web sites that publish information and speculation about Apple, its products and its plans. The company's lawsuit had all but confirmed the site's rumors — and the audience was essentially waiting to hear what it already knew.

Apple, one of the most famously secretive companies in the technology business, frames this case and several like it as little more than attempts to protect massively valuable trade secrets. The issue strikes me as questionable, and the larger reality is an Apple-singed dagger at one of the foundations of free speech: a vibrant press.

IT may think it has no horse in this race. I think IT should — ahem — think differently. A culture of secrecy, enshrined in law, would make it even harder for companies to know what's going on, in a time when transparency should be ascendant.

In the case at hand, the target is Think Secret (www.thinksecret.com). The site, operated by a Harvard freshman named Nicholas Ciarelli (who goes by the site pen name of Nick dePlume), had apparently gotten in-

formation that was leaked by someone, perhaps inside Apple, about the consumer products Apple would be announcing.

Apple has said in statements that Think Secret induced people to violate nondisclosure agreements and that this somehow gives Apple a cause for legal action. That's debatable, but I'm fairly sure of this: if the party leaking information to Think Secret had sent it to, say, the *San Jose Mercury News* or *The New York Times* — and had

those publications run the news, as they no doubt would have — Apple wouldn't be suing. Both newspapers have deep enough pockets to defend themselves.

This case looks to me — and to prominent San Francisco lawyer Terry Gross, who is representing Think Secret at no cost — like a bald attempt to bludgeon a publisher into submission. In media interviews, Gross has said he believes that the case is about intimidation, not about finding the source of the leaks.

The Think Secret case isn't the first time Apple has sent its lawyers after

Web sites that posted information about possible upcoming products. Late last year, the company sought subpoenas requiring various sites to reveal their sources, and it got a court order. The Web sites are fighting the subpoenas on the grounds that they are journalists under California and federal law. (Disclosure: I have agreed to file a declaration on their behalf, saying that they are indeed performing a journalistic function. I am not being paid to do so.)

In all of these cases, free speech is the target. While we can sympathize with Apple's desire to keep product announcements quiet until the day it wants to make them, a vibrant press is more important than a company's product secrecy — despite Apple's pious claim that it's not attacking free speech.

If a company wants to take steps to control its own employees' activities, including firing or suing workers who reveal secrets, that's its right. When it seeks to put a gag on the people who merely receive the information, that's going way too far.

READERS' LETTERS

Stronger, Longer Passwords May Not Lead to Better Security

ILONG AGO REALIZED that the more difficult one makes a password, the greater the likelihood that it will be written down and kept in an obvious location (typed in a monitor, for example). I've made lots of simple suggestions, such as typing a password with caps locked while using the shift key to get something like "pASSWORD," typing a familiar number while pressing the shift key, or using pseudonyms [*"The Computer Is Useless (Probably)"*; *QuickLink 5072*]. None of it works.

In my opinion, the only workable solution for real security is biometrics. I just hope they become affordable to us all too late.

T. ROSS VALENTINE
Senior network administrator,
Technology Re-Visions,
Plano, Ill.
tvalentine@yahoo.com

ONE WAY I've found to come up with hard-to-guess but easy-

to-remember passwords is to use one of the freely available "pronounceable" password generators available on the Internet. It would be more secure to generate them without the internet, I suppose, but I can't force the generated passwords by adding digits and punctuation.

Thomas Sweenan
Consultant, Vienna, Va.
tsweenan@juno.com

C. J. KELLY'S NOTION that a long passphrase is stronger than a password is a fallacy. This hypothesis may appear correct from a purely statistical perspective (permutation computation). However, if a smart dictionary attack is used, passphrases are rather simple to crack, especially if the passphrase forms an intelligible sentence that can easily be guessed by the attacking application.

Jay Barber, CRISP Dallas

THE QUESTIONS TO ASK are, "What needs to be recovered?" and, "How secure does it have to be?"

Locking down entire workstations is a bit over the top when the worst thing that could happen is that an unauthorized person could browse the Web or use the word processor.

The standard password policy is good enough to secure workstations, but storage of confidential files should use something like biometric verification of a password.

There is a whole array of finger print, hand geometry and face recognition readers available (so one should use the unhealthy scars). There is also software that allows access only when a hand, a finger or the face is presented.

In regards to cost-effectiveness and space conservation, fingerprint readers have the head hon, but fingerprints require huge templates

compared to hand geometry in order to accurately identify a person.

Finally, the weakest link in the chain is the authorized personnel. Even the thickest door is like air when the one holding the key is careless or inadvertent.

Security is a matter of managing access and maybe even micro-managing access down to a director or file level.

David Krings
Bristow, Conn.

EMC CLARION® CHANGES THE WAY YOU THINK ABOUT STORAGE. Available in 1TB, 2TB, 3TB and 4TB capacities, EMC CLARION is the first 3.5" disk array designed for both server and storage environments. With the quality and high availability that CLARION is known for, it's a great choice for your business. It's powerful, yet pliable for storage, SAN, RAID, clustering, replication and management functionality. All at a price that's equally great, starting at \$1,799. To learn more about EMC CLARION, call 1-800-442-4646 or visit www.EMC.com/Clarion. Or visit www.EMC.com/clarion.

Not all distributed EMC products may be available in all countries.

Bayesian Logic and Filters

Bayesian logic is a type of statistical analysis discovered by Rev. Thomas Bayes (right) that can quantify an uncertain outcome by determining its probability of occurrence. Bayesian filters are used in spam-control software because they can adapt over time using new data. **Page 28**

SECURITY MANAGER'S JOURNAL

Keeping Wireless Rogues in Check

It took months of testing and wrestling with budget constraints, but Matthias Thurman has finally come up with a wireless policy. **Page 30**

OPINION

Why IT Projects Fail

Jian Zhen outlines five of the most common causes of project failure and offers suggestions to head them off before a project begins. **Page 31**

Organizations are turning to **security information management systems** to coordinate all the disparate defenses on their networks. **By Drew Robb**

Iraq isn't the only war costing billions. According to Gartner Inc., 4% of IT budgets now go to security hardware and software as companies deploy an army of firewalls, intrusion-detection and prevention systems, antivirus tools and VPNs, as well as authentication, access-control and identity management systems, to keep out hackers, criminals and other marauders.

But as any commander will tell you, battlefield success isn't just a matter of superior firepower. It also depends on communication.

From an IT standpoint, the challenge is how to best turn a ragtag bunch of security assets — each with its own log files, its own data structures and its own rules — into an elite defensive unit. To achieve this, companies are turning to security information management (SIM) software, which is designed to do for security what products such as Tivoli have done for networks — simplify management, provide greater visibility and improve response times.

Chaim Feldman, network and systems security manager at Bezeq-The Israeli Telecommunications Corp., Israel's national telecommunications provider, reports that his company wards off 3,000 to 4,000 attacks

per month. "To gain control over the situation, he installed Computer Associates International Inc.'s Trust Security Command Center (SCC). "Before I had this, I was kind of blind," he says. "I couldn't actually see all of my company."

Stopping the Data Deluge

Establishing comprehensive security requires more than just deploying an ever-expanding array of software and devices. It also means turning them into a coordinated set of managed assets.

"Everything was a big mess," says Jim Patterson, security analyst for the Illinois state government's Legislative Information System. "Even from a major vendor like Cisco, each device had its own reporting console."

To make matters worse, Patterson found that each device's software package typically had to run on its own PC. That meant having to track alerts from an array of machines, all of which needed to be logged onto separately.

Further complicating the issue, the firewalls generated more log traffic than the built-in database could handle. At the recommendation of Cisco Systems Inc., Patterson installed nFX Open Security Platform from netForensics Inc. in Edison, N.J.

"With SIM in place, you can reduce the number of people you need to have monitoring things, since everything is

Continued from page 21
 coming into one central station," says Patterson.

Security information management (also called security event management, or SEM) is an outgrowth of the event logs that managers used for operations management but is tailored to gather data from security devices.

"The big differentiator is that, in addition to all the logs, a SIM can intake data from devices that don't generate logs or that generate robust but very specific proprietary information," says Gartner analyst Amit Williams.

One of the key functions is to reduce the number of false or inconsequential alerts that employees must review.

"We began implementing intrusion-detection systems a few years ago," says Chris Rein, chief of infrastructure and production services for the New Jersey Office of Information Technology. "The volume of data would overwhelm any person or small group looking at it."

Rein's experience is far from unique. Ulises Castillo, CEO of Scitum SA, a managed security service provider in Mexico City, says that he feeds 3 million to 10 million events per day from the 350-plus devices he manages into his Security Threat Manager 3 SIM from OpenService Inc. in Westboro, Mass. In doing so, he reduces the number of alerts by a factor of 10,000.

Dan Lukas, lead security architect at Aurora Health Care, a Milwaukee-based provider with 30,000 employees at 13 major hospitals and several hundred clinics and pharmacies, says that depending on the time of day, his company receives as many as 5,000 to 10,000 events per second. He uses IntelliTactics Network Security Manager from IntelliTactics Inc. in Reston, Va., to visualize the source of problems.

"We can play events back and see what devices it is hitting and track it back," says Lukas. "We have quite a few thousand switches out there, but we are getting to the point where we can see which port in the entire network a situation is coming from."

Companies looking to install SIM systems have a choice between server-based software and appliances. The New Jersey government chose the latter option. It uses PN-MARS appliances from Protego Networks Inc., which was recently acquired by Cisco. Rein says the state started with a few appliances for testing and is now purchasing more to put its WAN under complete surveillance. Beyond that, it will enter into agreements with agencies to set up more specific and granular

Plenty of Technology, Management Needed

By Michael J. Karpoff, Special Correspondent

monitoring of internal networks.

"Staff feels strongly that it has helped them improve their productivity level, since they don't have to mitigate as many issues as they experienced before," says Anna Thomas, New Jersey's chief of strategic development and digital communications.

Beseq took the software approach. The company runs CA's eTrust SCC on a server sitting on a separate security network that monitors two production networks — one for customer services

and another for internal operations.

Feldman says that having the SCC has given him better visibility into the types of attacks on his network and where they are hitting. For example, he once spotted a recently fired employee attempting to gain access to a sensitive server. Another time, the data-correlation feature detected a virus starting to spread, allowing Feldman's staff to disconnect the subnet to stop it.

Setting Expectations

Implementing a SIM is a major undertaking. Installing the software or appliance itself is generally simple enough, but setting up the desired monitoring and reducing the number of false positives takes work.

"When [companies] embark on a large SIM project — about 300-plus audit sources/devices — they should put aside at least \$50,000 in services budget for the vendor or a competent third party to come in, install and tune for appropriate business requirements," says Paul Proctor, an analyst at Meta Group Inc. "Deployments involving over 1,000 monitored nodes are usually multiyear efforts, so we set realistic expectations and project goals."

John Summers, Unisys Corp.'s global director for managed security services, is engaged in just such a large-scale project. He's installing ArcSight Inc. software at his company's three security operations centers, which manage security for 200 customers in addition to handling Unisys' own needs. The installation began in June 2003, and Summers expects to be able to view security events on a global scale sometime in the first half of this year. He can already manage customers on an individual or regional basis and has been able to detect zero-day attacks on one customer and harden the defenses of other customers before they're hit. "The only way to do that is to have a platform that can do complex pattern detection across a heterogeneous infrastructure and across time," says Summers.

Michael Gabriel, corporate IT security manager at Career Education Corp. (CEC) in Hoffman Estates, Ill., recently installed netForensics software to meet the auditing requirements of the Sarbanes-Oxley Act. "It's a bit of a challenging environment, since we run a number of separate Active Directory forests," he says. "We have a collector device in each AD forest, which collects the events from the Windows Domain Controllers, firewalls and IDSs and sends these to a centralized netForensics collector."

To meet the regulatory deadline, CEC purchased five days of consulting time to quickly get the netForensics software up and running. That was enough to establish compliance, but Gabriel says he still has a lot of work to do to fully use the system's functions. "It's a complex system, and you will get out of it what you put into it," he says. "I still feel we have just scratched the surface of its capabilities."

Part of what companies must put in is the work to ensure data quality. "SIM suffers from a huge garbage-in/garbage-out problem, and most of the data collected by enterprises is garbage," says Meta Group's Proctor. "They don't usually realize this until after spending several hundred thousand dollars on a huge monitoring infrastructure only to realize they are deriving on benefit."

Like other types of management software, SIM is only a tool. It can assist your security personnel in better securing the enterprise, but it's not a replacement for their perception and skills.

"You automate data collection, data correlation, data search — the tasks that are boring and suitable for computers," says Bruce Schneier, an author and chief technology officer at Counterpane Internet Security Inc. in Mountain View, Calif. "But you can't automate intelligence, and you can't automate creative thinking." © 2003

 coming into one central station," says Patterson.

Security information management (also called security event management, or SEM) is an outgrowth of the event log that managers used for network management but is tailored to gather data from security devices.

"The big differentiator is that, in addition to all the logs, a SEM can intake data from devices that don't generate logs or that generate robust but very specific proprietary information," says Gartner analyst Amitai Williamson.

One of the key functions is to reduce the number of false or inconsequential alerts that employees must review.

"We began implementing intrusion-detection systems a few years ago," says Chris Rein, chief of infrastructure and production services for the New Jersey Office of Information Technology. "The volume of data would overwhelm any person or small group looking at it."

Rein's experience is far from unique. Ulises Castillo, CEO of SSM SA, a managed security service provider in Mexico City, says that he feeds 3 million to 10 million events per day from the 350-plus devices he manages into his Security Threat Manager 3 SIM from OpenService Inc. in Westboro, Mass. In doing so, he reduces the number of alerts by a factor of 10,000.

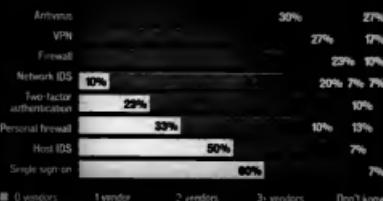

Dan Lukas, lead security architect at Aurora Health Care, a Milwaukee-based provider with 30,000 employees at 13 major hospitals and several hundred clinics and pharmacies, says that depending on the time of day, his company receives as many as 5,000 to 10,000 events per second. He uses intelligent Network Security Manager from Intellectrics Inc. in Reston, Va., to visualize the source of problems.

"We can play events back and see what devices it is hitting and track it back," says Lukas. "We have quite a few thousand switches out there, but we are getting to the point where we can see which port on the entire network a situation is coming from."

Companies looking to install SIM systems have a choice between server-based software and appliances. The New Jersey government chose the latter option. It uses FIM-MARS appliances from Protego Networks Inc., which was recently acquired by Cisco. Rein says the state started with a few appliances for testing and is now purchasing more to put its WAN under complete surveillance. Beyond that, it will enter into agreements with agencies to set up more specific and granular

Plenty of Technology, Management Needed

How many vendors' products have you currently deployed for

layer monitoring of internal networks.

"Staff feels strongly that it has helped them improve their productivity level, since they don't have to mitigate as many issues as they experienced before," says Brian Thomas, New Jersey's chief of strategic development and digital communication.

Berecz took the software approach. The company runs CA's eTrust SCC on a server sitting on a separate security network that monitors two production networks — one for customer services

and another for internal operations.

Feldman says that having the SIM has given him better visibility into the types of attacks on his network and where they are hitting. For example, he once spotted a recently fired employee attempting to gain access to a sensitive server. Another time, the data-correlation feature detected a virus starting to spread, allowing Feldman's staff to disconnect the subnet to stop it.

Setting Expectations

Implementing a SIM is a major undertaking. Installing the software or appliance itself is generally simple enough, but setting up the desired monitoring and reducing the number of false positives takes work.

"When [companies] embark on a large SIM project — about 300-plus audit sources/mods — they should put aside at least \$50,000 in services budget for the vendor or a competent third party to come in, install and tune for appropriate business requirements," says Paul Proctor, an analyst at Meta Group Inc. "Deployments involving over 1,000 monitored nodes are usually multiyear efforts, so set realistic expectations and project goals."

John Summers, Unisys Corp.'s global director for managed security services, is engaged in just such a large-scale project. He's installing ArcSight Inc. software at his company's three security operations centers, which manage security for 200 customers in addition to handling Unisys' own needs. The installation began in June 2003, and Summers expects to be able to view security events on a global scale sometime in the first half of this year. He can already manage customers on an individual

The Market And the Players

According to Gartner, the worldwide SIM market had grown to \$300 million by 2003. The Stamford, Conn.-based research firm also estimates that 20% of Fortune 1000 companies were using or currently planning to implement a SIM in 2004, and that vendors could double their installed base in 2005.

The SIM market is divided into two main categories. First, there are providers that specialize in SIEM. Then there are solution-oriented providers, like Symantec, McAfee, Trend Micro, and Network Intelligence Corp. Then there are larger companies that sell SIM products to consumers that offer integrated or modular solutions.

Other vendors' products may only offer some components of a SIM, while the larger companies offer products that are complementary with their other offerings and that they can sell to their existing clients.

- Drew Roble

or regional basis and has been able to detect zero-day attacks on one customer and harden the defenses of other customers before they're hit. "The only way to do that is to have a platform that can do complex pattern detection across a heterogeneous infrastructure and across time," says Summers.

Michael Gabriel, corporate IT security manager at Career Education Corp. (CEC) in Hoffman Estates, Ill., recently installed netwitness software to meet the auditing requirements of the Sarbanes-Oxley Act. "It's a bit of a challenging environment, since we run a number of separate Active Directory forests," he says. "We have a collector device in each AD forest, which collects the events from the Windows Domain Controllers, firewalls and IPMS and sends these to a centralized netwitness collector."

To meet the regulatory deadline, CEC purchased five days of consulting time to quickly get the netwitness software up and running. That was enough to establish compliance, but Gabriel says he still has a lot of work to do to fully use the system's functions.

"It's a complex system, and you will get out of it what you put into it," he says. "I still feel we have just scratched the surface of its capabilities."

Part of what companies must put in is the work to ensure data quality. SIM suffers from a huge garbage-in-garbage-out problem, and most of the data collected by enterprises is garbage," says Meta Group's Proctor. "They don't usually realize this until after spending several hundred thousand dollars on a huge monitoring infrastructure only to realize they are getting no benefit."

Like other types of management software, SIM is only a tool; it can assist your security personnel in better securing the enterprise, but it's not a replacement for their perception and skills.

"You automate data collection, data correlation, data search — the tasks that are boring and suitable for computers," says Bruce Schneier, an author and chief technology officer at Counterpane Internet Security Inc. in Mountain View, Calif. MODELING Magic

IT-based operations research builds better supply chains at Procter & Gamble. By Gary H. Anthes

OPERATIONS RESEARCH, the application of modeling and mathematics to business problems, had had a checkered history at The Procter & Gamble Co. since it was first tried in 1966. That all changed in 1993, when P&G hit a financial home run using process and operations research (OR) leap to prominence at the company.

In the early 1990s, the maker of Pampers diapers, Pert shampoo, Pringles potato chips and nearly 300 other consumer products decided to look broadly and deeply into its entire North American manufacturing and distribution network, and it tapped two IT staffers to join a team charged with reducing supply chain costs and improving efficiency. The project team developed computer models that pointed the way to a supply chain restructuring that would consolidate P&G's North American plants by 20% and lower supply chain costs by \$200 million a year.

"That project planted a seed," recalls Glenn Wegryn, one of the analysts on the project and now associate director of P&G's 17-person OR group, known as IT Global Analytics. "It really was a wake-up call about the capability you could provide by using OR tools tied to a deep understanding of how P&G's operations worked."

While many companies put OR in their engineering or research departments, P&G put its OR group in its IT shop. "IT is one of the very few organizations within a company that has true end-to-end visibility into all the operations of the company," says Wegryn. "Part of our success is that we are a crossover capability; we have as much business knowledge as we do knowledge of our instruments and tools."

Wegryn's group works on some 100 projects a year and has worked in every P&G product category and geographic region. Most, but not all, of the problems considered by Global Analytics can be thought of as supply chain questions: How many plants should there be for this new product, and where? Where should distribution centers be located? What's the optimum transportation network? How can we deliver faster and better to these particular customers?

Global Analytics has no fixed annual budget; instead, it must find internal clients willing to fund its services. Wegryn is guarded about the financial results of individual projects, but he will say that he aims to save P&G 10 times his group's salary costs on OR projects. "We far exceed that goal," he adds.

P&G applies IT-assisted analytic techniques in three broad areas. First, it uses optimization models to determine how best to allocate supply chain resources, most often on the basis of next value.

Second, simulation models allow P&G to mathematically try out various options to see how they might play out over time, to test the sensitivity of results to changes in key variables. Simulation and optimization models are often used together. An optimization model may point to an option that is further evaluated and tweaked by simulating how a supply chain would behave under that option and how stable it is.

"We've found that the success of a supply chain is not necessarily operating at the absolute optimal solution, but operating at one of the more robust solutions in the real world," says David Dittmann, Global Analytics manager.

Third, the company uses decision analysis, which involves the use of techniques such as decision trees that combine the probabilities of various outcomes and their financial results.

Levels of Complexity

P&G's models are implemented in several ways, depending on the complexity of the problem. Some are written in Microsoft Excel, which is often pushed way beyond the capabilities of simple spreadsheets by commercially available add-ons. For example, P&G sometimes uses What'sBest from Lindo Systems Inc. in Chicago to build large-scale optimization models within a spreadsheet. Another favorite is PrecisionTree, a tool for building decision trees inside spreadsheets from Palisade Corp. in Newfield, N.Y.

P&G also uses stand-alone OR packages, such as Xpres-MP from Dash Optimization Inc. in Englewood Cliffs, N.J., and Cplex from Ilog Inc. in Mountain View, Calif., which are for constructing optimization models. It uses Extend from San Jose-based Imagine That Inc. for building simulation models. Dittmann says some of the packages require programming — coding rules to define objectives and constraints, for example.

While the models are developed by Dittmann and others in Global Analytics, the data is maintained and served up by traditional IT resources. Most of the information comes out of a 25TB Oracle data warehouse called SourceOne, which contains 36 months of supplier, manufacturing, customer and consumer histories by region.

But it would be a mistake to give all the credit for the success of OR at P&G to higher math and clever algorithms

churning through terabytes of information. "That's really the key to OR is not just the technical side; it's also the very deep understanding of how a business operates," Wiegert says.

Indeed, the OR people at P&G say their skills as business consultants can make all the difference. Joe Kahn, a section manager in Global Analytics, says he helps internal customers move their problems "from the gut to the head." He often begins OR projects by asking his customers these questions: What are you trying to decide? On what measure will you have a decision? What are the options? What's bothering you, and what's uncertain?

Kahn helps users answer those questions in a meeting that typically lasts a day or less. A six-month project to develop and run sophisticated models may

come next, but not always. Says Kahn, "About one out of five or six times, people say, 'Now I understand it. I don't need to do any more analysis. I didn't realize my options were so simple.'"

Jean Kinney, a purchasing manager at P&G, tells of the launch of a new global health care product whose success hinged on the careful choice of plant locations and sources of raw materials. "It was extremely complicated, and there were literally millions and millions of possibilities," she recalls. "If you went to the managers in the countries that would be marketing this product, they'd all say, 'Well, the plant should be located in my country.' But if you talked to some of the corporate experts, they'd say, 'But scale is important. You should build one big megafactory somewhere. And there were millions of options in between. So how do you come up with the best approach? Modeling techniques allowed us to do that.'

To help Kinney solve the problem, Global Analytics constructed Excel-based models using Lindo's What'sBest for optimization and the Palisade's @Risk add-on module for Monte Carlo simulation, in which values for uncertain variables are randomly generated. The models sought to maximize net present value and, for each country, considered manufacturing costs, freight costs, taxes, import/export duties, local wage rates, cost of capital and more.

"At the beginning of the project, I asked all the team members to write down where [they thought] we would end up — how many plants, and where would they be located," Kinney says. "No one came close."

Michael Pollicastro is director of customer service and logistics for P&G Global Beauty Care, and he says he has not one supply chain to worry about but hundreds — combinations of suppliers, manufacturing facilities and markets. "And if you multiply that by 10 or 15 new initiatives or product launches a year, it quickly mushroom into a hugely complex work process to design all those supply chains," he says. "Then there's the range of options open to you [in each] supply chain, so you leverage IT to help you with that process."

P&G has dozens of beauty care products, each coming in multiple sizes and package designs. Change is constant, and the timeliest modification can ripple through the supply chain. "A simple cap change may, for example, only be sourced from a Chinese supplier, and now I've added 60 days to my supply chain time," Pollicastro says. "What does that do to inventory levels, service levels, costs and so on?"

The complexity of his supply chains and the consequent need for automated OR techniques will only grow, says Pollicastro, as P&G increasingly tries to address the needs of each of the retailers it works with, as well as the needs of different groups of consumers. "A Wal-Mart hair-care shopper may not have the same needs as a Target shopper," he says. "We are now going through customers and channel differentiation and are marrying that with greater consumer insights."

"Having worked with Global Analytics for a couple of years, I think they embody the term *IT* — information technology — very well in the sense that they couple not just the technology of analytics, modeling and options analysis with information, but also with the knowledge of key supply chain information such as import duties, the latest tariff regulations, trends in labor costs, and P&G manufacturing principles," Pollicastro says.

He says it's good that Global Analytics must fund itself by finding paying customers inside the company. That way, he explains, "their survival depends on the quality of their services." □ **By Steve Lohr**

Bayesian Logic And Filters

DEFINITION

Bayesian logic is a type of statistical analysis that can quantify an uncertain outcome by determining its probability of occurrence using previously known, related data. Bayesian filters are used in spam-control software because they can adapt over time using new data.

BY MURKILL KAY

SOmetimes it's easy to say that if you can't measure something, you're not doing science. Bayesian logic offers a way to measure things that were previously unmeasurable, allowing us to test hypotheses and predictions and thereby refine our conclusions and decisions. Bayesian filtering is a hot topic in the area of spam control today.

Basic probability is simple to calculate, because you're dealing with a limited number of factors and possibilities. Let's consider a horse race with 10 horses entered. If that's the only information we have on which to base a wager, then we could pick any horse on the basis that its chance of winning is 1 in 10, or 0.1. Take that kind of math to the track, however, and you'll quickly be separated from the contents of your wallet. The real world is far more complicated, and here's where Bayesian logic comes into the picture.

In fact, each of the 10 horses has already run at least a few races and therefore has a history. If Lightning has won every race he's entered, and

Thunder has lost every one he has entered, then we've got a real evidential basis on which to bet on Lightning instead of Thunder.

In fact, there's a lot more information available about every horse in the race. We know or can easily find out the following:

Usage: Is this horse the offspring of a champion? How many brothers and sisters does it have?

Performance under different weather conditions: If it rains in the morning and the track is soft, how does that affect his speed?

Position on the track: Is our horse next to the rail or on the outside? And how does the horse react when he's in that position?

Length of time since last race: If the horse ran a long, hard race yesterday, how well is he likely to run today?

Distance of today's race: How has the horse fared at this distance in the past?

Other people's betting patterns also come into play. They don't affect how well a horse will perform, but they have a clear impact on the size of the payoff if he does win.

All of this information can help us make a better estimate of our horse's chance of winning than the simple 1 out of 10. Analyzing these factors is a Bayesian process.

Similar things are happening in the world of Major League Baseball — ever the province of voluminous statistical records. Team owners and general managers are using Bayesian analysis when they study the way players perform under various conditions and in specific situations and factor that information into their decisions about the players they want to draft or seek in trades.

Bayesian Antispam

The application of Bayesian logic to the spam problem got its start in Paul Graham's 2002 paper "A Plan for Spam" (www.paulgraham.com/aspam.html), an approach that was soon adopted by numerous developers. Bayesian spam filtering is based on the notion that the presence of certain words will indicate spam, while other words will identify a message as legitimate. It has that in common with other types of scoring-content-based filters, but with the added advantage

that Bayesian filters create their own lists of telltale words and characteristics rather than working from lists created manually.

A Bayesian filter starts by examining one set of e-mails known to be spam and another set known to be legitimate (the prior knowledge). It compares the contents for both sets — not just the message body, but also header information and metadata, word pairs and phrases, and even HTML code for information such as the use of specific colors. From this, it builds a database of words, or tokens, with which it can usefully identify future e-mails as spam or not.

Bayesian filters take into account the whole context of a message. For example, many spam messages contain the word free in the subject line, but so do some legitimate messages. A Bayesian filter notes this word but also looks at other tokens in the message, because falsely identifying a real message as spam (called a false positive) causes more problems than letting some spam through as legitimate.

According to proponents, less than 1% of the messages identified as spam by Bayesian filters are false positives.

The Bayesian spam filter's real power, however, lies in its ability to learn. As the user tags new messages, the filter updates its database to identify new patterns of spam.

Bayes and His Theorem

Rev. Thomas Bayes (1701-1761), an English statistician, is credited as the author of "An Essay Towards Solving a Problem in the Doctrine of Chances." Published posthumously in 1763, the paper set out what we now call Bayes' Theorem, a formula for estimating the probability that something will occur based on the likelihood of related but independent events. I say "something" because, as we now understand, it's really the odds of a statement or proposition, such as determining whether a particular investment is a good idea.

Today, Bayes' Theorem is used in many applications, including spam filtering. The surprising gift is that the probability that email is still spam, when it says it's not, is 0.001. This means "We're probably still spam & will always, given that email is 0 has already happened." With 999 out of 1,000 emails, how is Bayes?

QUICK STUDY

I suspect that most readers wouldn't like this article especially helpful, and I'm not about to attempt mathematical derivation. But statistics certainly know it. Still, it does show that Bayesian analysis is based on probabilities that make use of prior knowledge.

For a nonmathematical explanation, read Edward Tufte's classic, step-by-step article titled, "An Intuitive Explanation of Bayesian Reasoning." <http://www.santafe.edu/~tufte/introduction.html> (University of Connecticut, 1995).

Wishing you clear thinking, Wally — you should not, at least at first, try to digest this entire page, and when you do, you should, if you have a mind, keep a notebook of things that confuse you.

QUICK STUDY

Bayesian Logic

What is Bayesian logic? Bayesian logic is a type of statistical analysis that can quantify an uncertain outcome by determining its probability of occurrence using previously known, related data. Bayesian filters are used in spam-control software because they can adapt over time using new data.

Keeping Wireless Rogues in Check

After months of testing and taking budget constraints into consideration, our security manager comes up with a wireless policy.

By Mathias Thurman

FINALLY SETTLED ON A strategy for wireless security.

As wireless access points began appearing on our company's network, we configured them with Cisco's Lightweight Extensible Access Protocol. (See my Nov. 8 column, "Taking the Leap to PEAP for Wireless." QuickLink 50430.) LEAP forces users to authenticate with their enterprise credentials — the same credentials used for virtual private network access, as well as services such as payroll and Microsoft Exchange e-mail. That's because we use a centralized directory that ties into most of our core applications and lets employees use a single password to sign on.

Although LEAP works well, we didn't want to take the chance that those enterprise credentials would become compromised if someone hacked the wireless infrastructure. So I decided to use Protected Extensible Access Protocol (PEAP) with RSA SecurID token authentication. This combination requires a wireless user to enter his user identity and his SecurID token, which is a personal identification number followed by a dynamic number that changes every 60 seconds. This way, even if PEAP is compromised to the extent that the user ID is obtained, the hacker would still need a SecurID token to gain access.

As I noted in November, we had to do extensive testing of this setup. Our current corporate standard is to issue Dell

laptops with the TruMobile client installed. Our testing showed that the TruMobile client works well with PEAP; SecurID and the Cisco access points. Our small contingent of Linux users will need a third-party client such as Aegis from Portsmouth, N.H.-based Meetinghouse Data Communications, which supports Linux and PEAP.

Another issue is capacity, since there's a limit to how many clients can associate to a single access point. Until we beef up our infrastructure, the plan is to restrict wireless access to users who demonstrate a business need. Once a user obtains management approval, we'll send him a SecurID token with instructions on how to configure his client.

With the PEAP/SecurID portion of our wireless policy in place, I turned my attention to evaluating and experimenting with various technologies for detecting rogue access points. My decision had to be based on several factors, the

Because the company operates worldwide, I decided to take both a wireless and wired approach to rogue access-point detection.

first being money. Unfortunately, my company is trying to conserve resources, and there just isn't enough money to outfit every remote office with wireless sensors.

Because the company operates worldwide, I decided to take both wireless and wired approaches to rogue access-point detection.

On the wireless side, we wanted to stick with Cisco. That wasn't because it has best-of-breed wireless sensors, but because we already have a relationship with Cisco and are already managing dozens of Cisco access points. We also believe that Cisco will eventually provide the type of functionality we're really looking for. In addition, if we use Cisco access points for rogue access-point detection, there's always the option of converting those devices back to access points.

Enterprise Searching

But we have remote offices where we can't deploy wireless sensors, and we still want to be able to discover the presence of wireless access points on the wired network. On an enterprise level, this can be accomplished in two ways.

The first is to assess every switch port's media access control address in order to find the wireless vendor's IDs (the first three octets of the MAC address). This isn't foolproof, however, since some wireless vendors also make wired equipment.

For example, Cisco makes both network hardware and wireless access points. If we come across a MAC address for what looks like a Cisco device, we could have a false positive for a wireless device.

Another problem with this method is that we might not have access to every switch in

our infrastructure. In our company, some of the engineering departments manage their own network gear.

The second way to detect wireless access points on the wired enterprise network is to scan every IP address and attempt to identify access points by the responses we get. If you know the signature of an access point, you'll know when your probing has hit one. The problem is knowing those signatures. It would be fairly simple to write scripts that would allow our Nessus scanning infrastructure to look for wireless signatures, but since each vendor could have its own fingerprint, we'd have to purchase every vendor's access points and run tests to get a proper fingerprint. Unfortunately, we just don't have the resources to tackle that task.

But we do have the resources to turn to San Mateo, Calif.-based AirWave Wireless Inc. Beyond its vendor-independent, centralized wireless management tool, AirWave has done all the legwork and fingerprinted more than 40 wireless access points. It then built a tool, called RAPIDS, that, among other features, scans the network for those fingerprints. By conducting some correlation with the MAC address scanning (which AirWave can also accomplish), we can determine whether a device that's been pinpointed by RAPIDS is rogue and then trace it back to the switch port to which it's attached.

All of this isn't a 100% fix for keeping rogue access points in check, but I feel that the combined wired/wireless approach will be about 90% effective. Over the course of the next several months, we'll deploy this technology and I'll be able to report back meaningful results.

WHAT DO YOU THINK?

The week's journal is written by a real security manager, Mathias Thurman, who is responsible for the security of thousands of devices from around the world. Contact him at thurner@phx.com, or join the discussion in our forum: QuickLink.phx.com.

SECURITY LOG

Security Bookshelf

Gray Hat Hacking: The Ethical Hacker's Handbook, by Sean Metzger, Mike Hearn, Chris Eagle, Jonathan James and Michael Lester (McGraw-Hill Osborne Media, 2004).

Security professionals should start with hacking tools and techniques in order to prevent attacks and ensure vulnerability. This up-to-date handbook offers information about topics ranging from the use of Elcomsoft and the writing and debugging of exploit code to the vulnerabilities of mobile apps as Core Impact and Immunity Security Causes. Questions test the reader's understanding of each chapter. Although I'd like more on certain subjects, such as writing Linux shell-code, the most important aspects of each chapter are well-covered.

— Mathias Thurman

ADL Aims to Secure Surfing

America Online Inc. has made plans to reduce the risk of attacks of its broadband dial-up service by preventing users from running malicious code while surfing the Web. With a frequently updated Manifest of Web sites allowed on the user's PC, NetHenge will alert users with a red shield mark to the browser bar to either associate with publishing or the distribution of spyware or other malicious code. NetHenge is based on Mozilla Firefox but also supports Microsoft's Internet Explorer browser engine.

Spyware on Rise

The most malicious forms of spyware increased dramatically in the last three months of 2004, according to the Spybot report from EarthLink Inc. and Webroot Software Inc. From October to December, the volume of spyware infections rose 200%, while the volume of trojans increased 240%.

BRIEFS

ManageSoft Offers Mac OS X Support

a ManageSoft Corp., in Boston, has begun providing support for Apple Computer Inc.'s Mac OS X operating system. The ManageSoft system is used for automatic deployment, updating and management of software and security patches. Support for Mac OS X allows customers with heterogeneous environments to manage their desktops, servers and handheld devices, the company said. The product is priced at \$72 per device.

Opinity Ships Ops Management App

Opinity Inc., in Bethesda, Md., is shipping C20, an operations process management system. It will improve the control, speed and reliability of application-support activities by automating administrative and problem-resolution tasks normally handled by operations personnel, according to the company. Pricing for C20 starts at \$10,000 for a multi-server application environment.

Dell Introduces Business Notebooks

Dell Inc. last week announced three business notebook computers. The D410 weighs 3.85 lbs., has an optional Intel-based extended battery and sells for \$1,677, the company said. The A470-B, D900 starts at \$1,694. The D900 features a 15.4-in., wide-angle display and 128MB of dedicated memory for graphics. It weighs 6.40 lbs. and sells for \$1,549.

HP 'Latch' Could Replace Translators

Hewlett-Packard Co. researchers last week said they have developed a one-day-one-latch technology that may one day replace the translator and shrink the size of computers. Called the "crusher latch," it can perform functions now handled by larger translators.

JIAN ZHEN

Why IT Projects Fail

IT'S ESTIMATED that over 50% — some say 80% — of all large IT projects fail. The reasons for that startling failure rate aren't mysterious. Too many companies make the same mistakes too many times. I've identified five of the most common causes for failure. I've also come up with some questions your organization should answer before it starts a project, to boost the chance of success.

1. The project's real value isn't understood. When calculating ROI, be sure to have a clear understanding of the total cost of ownership. Without a concrete TCO, the ROI figures are meaningless.

Understanding the various ROI metrics, acknowledging that these are fuzzy metrics and clearly defining what the organization expects from a successful implementation will produce a clear view of the project's value.

2. You don't know your users. Who are the main users of the technology you're implementing? Are they business users or technical users, power users or casual users?

Business users are usually from marketing, finance and other nontechnical groups in the organization. They want to see summaries, dashboards, charts, graphs and other reports that enable them to spot trends.

Technical users are usually from IT, security and other operations groups. These are the ones who want all the nitty-gritty details. They want to drill down and diagnose problems. They perform the root-cause analysis when things go wrong.

Power users want sophisticated interfaces and flexibility. They generally use the system three or four times a week or even every day, and they can be anywhere in the organization, including marketing and finance.

Casual users are on the system once

a week or less. They may not even log on at all and prefer to receive reports via e-mail.

3. Requirements aren't clearly understood. The only way to identify real requirements is to talk to potential users and get the answers to these questions: Are your requirements based on regulations, operational problems, performance, capacity optimization or trend analysis?

Do you have platform requirements — Windows? Linux? Java? .Net? How about requirements to integrate with corporate infrastructure?

What's your requirement on performance? Scalability? Extensibility? Manageability? Usability? Security?

Before evaluating any technology, answer those questions in detail. Don't choose a product or create unreasonable requirements because of brand loyalty or FOE (friends of executives).

4. You've limited your options. Too often, companies decide that only a commercial product will meet their requirements, before all the options have been evaluated.

Before you jump to a commercial solution, you should evaluate your resources and skills within your own organization and see if you can or should go open-source. There are many factors to consider when choosing among the commercial, open-source or home-grown options.

Do you have the resources (head

count) to support whatever option you choose? Commercial products may save you some development time and head count, but you may get faster feature updates if you have dedicated developers for a homegrown system.

Do your engineers have the necessary skills to maintain an open-source product or develop a homegrown solution? This really goes back to your requirements.

Even if you have the resources and skills within your organization, can you spare the time from other projects? What's your budget? It will vary based on the executive sponsor, the project's scale, its urgency and other factors.

Knowing your requirements will allow you to find the right option to meet them.

5. You don't have a clear understanding of the products available. Many of the IT products out there are strong in some areas and weak in others. Many vendors will tell you that they are strong in all areas. If they tell you that, run away as fast as you can.

Tell the vendors about your requirements. Ask them to rate how well each of their products meets your requirements. Ask for an evaluation. Ask them how their software/hardware compares with that of their competitors. Ask them to share their product road map. Ask about the support structure.

Never buy a product without actually using it. There's no way to tell whether it meets your requirements by looking at PowerPoint slides.

Try to be open-minded. There are no 100% solutions. Prioritizing your requirements will help you determine which system best fits your company.

Spending some time upfront will help you avoid these common problems and allow you to meet your real requirements. © 2005

It's tempting to hire your next IT manager from the crowded job market, but there's also value in building management skills the old-fashioned way. **BY MARY K. PRATT**

JOYCE L. YOUNG is adding three new manager positions to her 50-person IT group. She wants to fill the new slots by March. It's a tight schedule, but Young has a plan: Promote from within.

"I know I have to go outside for certain technical expertise I don't have inside, but I really try to look internally if I can," says Young, the Chicago-based CIO at CP Kelco, a J.M. Huber Corp. company.

As the list of required skills for technology and management jobs grows, CIOs like Young must decide whether to "build" or "buy" managers. Each strategy comes with its own benefits and drawbacks, so CIOs should weigh time requirements, organizational needs and even retention plans when deciding which way to go.

"There's no black-and-white answer. It's very situational," says Robert Rosen, president of Share Inc., a Chicago-based nonprofit organization of IBM users.

Leading CIOs, recruiters and employment experts agree that whether to build or buy shouldn't be viewed as an either-or question. In fact, they say, the best solution for any organization is one that includes both tactics.

"It's a mixed strategy," says Bruce J.

Buy OR Build?

Goodman, CIO at Humana Inc. in Louisville, Ky. "You want a team that has a lot of A players. And you have to identify and recruit A players wherever they are."

Goodman says companies that build management skills in-house are building loyalty and capitalizing on institutional knowledge, too.

He remembers one IT staffer who showed aptitude for leading others. Goodman put him in charge of the company's help desk, where, after some additional training, he proved his ability to run a team and get things done. "If we hadn't done that," Goodman says, "he might not have stayed around."

Statistics support that assertion. "There's a lot of bang for the buck growing them from within," says Beverly Kaye, founder and CEO of Career Systems International Inc. in Scranton, Pa., and co-author of *Love 'Em or Lose 'Em: Getting Good People to Stay*, Third Edition (Berrett-Koehler, 2005).

Kaye's recent survey of more than 1,000 IT workers at all levels found that exciting work and challenges, along with career growth, learning and development, are among the top factors that keep workers with their current employers.

Barbara Kunkel, CIO at Rochester, N.Y.-based law firm Nixon Peabody LLP, says building skills among existing workers has helped her create loyal staff members who feel passionate about their work.

"People become proud of what they do. You can't buy that. And you can't get it overnight," she says. "And I need consistent, passionate people who can move this organization forward." Of Kunkel's five direct reports, one has been with the firm for 29 years; two others have been there for nearly 10.

Retaining Knowledge

Building a management team from internal staff doesn't just breed loyalty, however. The process also guarantees what Rosen calls "corporate memory"—the knowledge of where things are, how things work together and the unofficial ways projects get done.

He remembers working at one company that hired a CIO who brought in new managers. Those managers then undertook initiatives that had previ-

ously failed at the company. "There were a lot of false starts done by the new people," Rosen recalls.

Bringing new people onboard can cost tens of thousands of dollars in headhunter and relocation fees, not to mention the costs of disruption in the office, experts say. But training existing staffers to move into management positions can be expensive too.

Young once worked at an engineering company that put a premium on employee retention. So when Young had to fill two IT management positions, she promoted workers who had spent their careers in the company's business division. She sent them to Northwestern University's 18-month executive program to earn master's degrees in IT. The cost? Nearly \$100,000.

Outside Advantages

CIOs and other employment experts are hard-pressed to come up with studies and comparisons between the costs of building or buying management skills. Data about the return on investment for each scenario is slim, they say, and most information is anecdotal.

For example, Goodman uses company-wide matrices to estimate costs. He says training and development amounts to about 2% of the payroll budget, while the cost to hire workers runs just under 2%.

With those costs about even, Goodman turns to the other benefits that come from external hires. For example, they can bring necessary skills or knowledge to an organization that doesn't have time to build them internally.

Others say hiring new IT managers can also infuse an organization with new ideas, innovative approaches and experience in markets or processes new to the company.

Companies that want to upgrade the level of leadership in a particular role might also have more success if they hire from the market, says Steve Kendrick, president of Kendrick Executive Resources Inc., an IT executive search firm in Dallas. In addition, companies looking for significant change in processes or strategies will likely have more success doing so if they seek management from the outside, he says.

Even those who prefer to build man-

It's a mixed strategy.
You want a team that has a lot of A players. And you have to identify and recruit A players wherever they are

MOST-VALUED Skills

When Pittsburgh-area IT executives recently gathered to discuss their hiring needs, it wasn't a while before they began talking about the technology skills they wanted.

In fact, "for the first 15 minutes of the conference, and continuing through an IT visit," says Jim Roberts, managing director of the IT industry marketplace at the Pittsburgh Technology Council.

Members of the IT Workforce Board involved said they word people who can work on multiple quickly and adapt to changing situations. They were people who understand business needs.

"The IT leader has to identify deliver solutions that add sustainable business value, if not even the business discounts them," says Dave Kendrick, president of Kendrick Executive Resources.

Business knowledge was another must. "A good group of business and attention to business details are more important today than in the past," says Stephen Peltz, president-elect of the Society for Information Management (SIM) in Chicago and vice president and CIO at PenFed Corp. in Bethesda, Md., N.J.

The ability to talk money is another high priority. IT managers need a greater understanding of costs, budgets and financial management systems, says Diana Mowat, a partner at Gemini Inc. in Stamford, Conn. They need to know about cost analysis and return on investment.

"Most businesses like to speak the language of money, and most IT people tend to be unable to do that," she says.

Agreement skills internally readily acknowledge these benefits. Ellen Barry, CIO at the Metropolitan Pier and Exposition Authority in Chicago, says she puts a high priority on training her most talented people and encouraging them "to grow into the professionals they want to become."

On the other hand, Barry says she can't always wait for that to happen. Sometimes you need to bring in new talent to get the skills that you don't have and can't rapidly build, she says.

That leads to a third shift: the ability to communicate. IT managers need to talk to business people, including those who sit on the board of directors. And they have to do it in everyday language, not technical jargon. "You really need to have the oral and written ability to get your ideas across," says David Lucas, president of SIM and CEO of Rockefeller Group International Inc. in New York.

IT managers need to learn how to manage. In new ways, as companies expect them to work more often with other business units and across geographic distances. They also have to know how to motivate people working halfway around the world. "Skills around building employees and getting them to work are big things," says Linda Avant, senior vice president of technology development at The Fortune Corp., a Boston-based management consultant and training company.

In this age of offshoring and international business, global experience can give a manager a significant edge. Kate M. Kaiser, associate professor of IT at Marquette University in Milwaukee, says foreign-language skills, specifically Mandarin Chinese or Russian, are helpful, as is global political awareness.

But none of this trumps the need to stay ahead of technology. Unitech Resources Inc. in the Cleveland-based vice chairman of executive search firm Christian & Toulouse says IT managers need strong vision and insight more often over. "The worst thing a CIO can do is implement a strategy that has to be changed again in 24 months," he says.

Two other highly desired skills—leadership and the ability to learn—will help IT managers fit all three other talents together. "To me, the No. 1 capability has got to be leadership," says Bert Baker, an Upstate, Maine-based facilitator for Management Learning and the facilitator for SIM's Northeast Regional Leadership Forum.

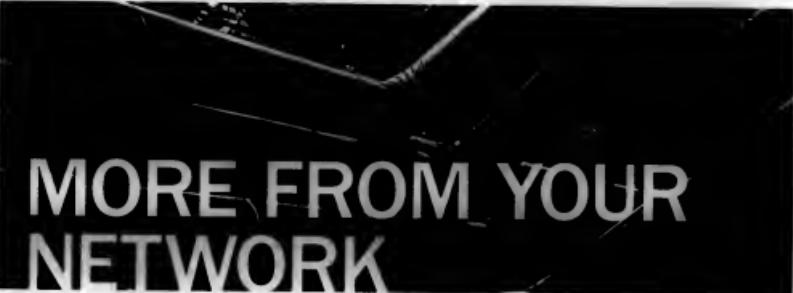

"Leadership is the Wright," says Baker. "It's the ability to make the tough call of not promoting people who weren't quite ready for management. In those cases, she hired experienced, qualified managers from the marketplace. Then she worked with the internal candidates to make sure they were ready the next time a manager's slot opened up.

© 2004

Barry has had to make the tough call of not promoting people who weren't quite ready for management. In those cases, she hired experienced, qualified managers from the marketplace. Then she worked with the internal candidates to make sure they were ready the next time a manager's slot opened up.

Get Ready for the Hispanic Nation

You've heard the stats: The fast-growing Hispanic population in the U.S. is 43.5 million strong, and 12.6 million Latinos are already online. Hispanics have about \$575 billion worth of spending power and in two generations will make up nearly a quarter of the workforce.

Are your systems ready?

Your interactive voice response systems need to have a Spanish-language option, your call centers should have Spanish-speaking agents, and your Web site needs a clear link to

content in Spanish.

But only 19% of Fortune 100 companies offer Spanish-language content on their Web sites, according to reports by Ron Rogowski, an analyst at Forrester Research Inc. And even Web sites that do offer some Spanish text fall down when it comes to allowing actual financial transactions in Spanish or optimizing their search engines for Spanish queries, Rogowski says.

But some companies are getting the message. Verizon Communications Inc. places its Spanish link prominently at the top of its Web page and encourages Spanish-speaking call center agents to promote the Spanish Web site. H&R Block Inc. users can get maps and driving directions to local offices with Spanish-speaking drivers. And Home Depot Inc. even remembered to put its privacy policy in Spanish.

Among state governments, Texas is the only one to provide a full-fledged Spanish-language Web portal for constituents, says Rogowski.

The most useful parts of recent business and IT management books.

Best Face Forward: Why Companies Must Improve Their Service Interfaces with Customers by Jeffrey F. Rayport and Bernard A. Jaworski (Harvard Business School Press, 2005)

Nicholas Carr would love this book (that says real competitive advantage will come from superior "customer service interfaces," not technology). But wait. Nick! The au-

thors go on to say that the key to better customer service is finding the right combination of people and machines for the situation.

Sometimes, people are dominant on the front lines (think of call centers), while the technology is in the background helping them work smarter. And sometimes the technology is in the foreground (think of airline ticket kiosks); while people are available as a backup option or if something goes wrong. The people-machine combo could be as simple as teaming clerks who use handheld com-

puters to take fast-food orders when the lines get too long, or it could be as complex as Wal-Mart's inventory replenishment system. "In essence, Wal-Mart is a [supply chain] machine with a human face," the authors say. Probably the most useful part of the book is the last chapter, which provides an "interface audit," a scorecard for rating your company's customer service interfaces in terms of effectiveness and competitive advantage

- Mitch Beets

Things to Ponder

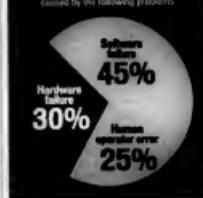

Privacy already tops the list of consumer worries about radio frequency identification technology, with 60% of consumers saying they are somewhat or very concerned about companies using RFID to monitor transactions and purchasing habits, according to a December 2004 study of 8,500 consumers by Antennet LLC in Fremont, Calif., and BigResearch LLC in Worthington, Ohio.

Dee's your Web analytics software depend on cookies for tracking customer surfing habits? You may need to rethink that business model now that nearly half of North Americans own spyware removal software and regularly delete the tracking cookies, says Bob Chatham, an analyst at Forrester Research Inc.

Companies that use e-procurement applications have reduced the amount of maverick or off-contract spending by an average of 64%, according to a benchmarking study by Aberdeen Group Inc. in Boston. © 52121

Causes of Downtime

The percentage of IT downtime occurrences caused by the following problems:

Send them to
pitchess@computerworld.com

The IT Economy

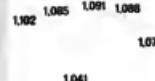

■ Some press reports suggest that we're experiencing an IT "lull," marked with flat demand and rising price concessions from vendors. But in December 2004 survey of 100 CIOs, 69% said the level of discounting by IT vendors had changed, and pricing remains relatively flat, according to The Goldfarb-Sacks Group Inc. in New York. One quarter of the CIOs surveyed said discounting is currently increasing, and 14% said discounting is decreasing.

■ When asked by Forrester Research about their top priorities for this year, 800 IT decision-makers at North American companies came up with this top-four list: Deploy or upgrade a major software application, upgrade disaster recovery capabilities, support corporate governance (such as Sarbanes-Oxley Act compliance) and upgrade security.

Buying Intentions

ICC researchers say their index of business IT demand (below) shows that user spending expectations have stopped rising. Maybe it's a case of the winter blues, because buyer expectations were low in January 2004, too, and then peaked in August and have been on a downward slide since then, says John Gantz, ICC's chief research officer.

Index of Business IT Demand: 2004-2005

Aug. Sept. Oct. Nov. Dec. Jan.

The buyer intent index is based on monthly surveys of 400 to 500 U.S. CIOs and business executives, who are asked to rate their IT spending intentions for the next 12 months. Results are weighted to reflect the representation of the U.S. market. An index of 1.000 means zero growth. Current spending intentions don't change lead to real spending.

SO You Want To Be a CIO

Technical and business skills, good judgment and good timing will all help, but leadership is the linchpin.

BY JOHN PARKER

AN IT DIRECTOR at a small home health care organization recently asked me about how best to achieve his goal of becoming a CIO. The organization was "getting over a downsizing," and he was planning on leaving to pursue his career. I've been giving the question some thought, and here's how I see it.

There is no formula for becoming a CIO. To land the job, four things must happen. There has to be opportunity (that is, an open position), you must be in the candidate pool, you must distinguish yourself from other candi-

dates, and you must be willing to take the job.

There isn't much you can do to create opportunities, nor can you affect their timing, so you should avoid the temptation to try. You don't want a reputation as an opportunist, which would be virtually guaranteed to stall your career growth. As hard as it can be, you must be patient.

But while you're waiting, prepare yourself to take advantage of opportunities. Decision-makers are typically looking for certain personal behaviors and experiences as they fill open positions. You can practice those behaviors

IT MENTOR

Get intimate with the numbers. The language of business is money, and if you

and pursue jobs that create the experience that will help you to stand out from the crowd. The following thoughts may help steer you toward your goal.

Become an outstanding leader. It all starts here. There's a big difference between management and leadership. There are a lot of really smart, highly technical managers out of work right now. But for a strong leader with an IT background — particularly with business experience — opportunity not only knocks on the door, it almost rips the hinges off.

How do you become one? You can't become a leader by reading this article or a book on leadership. You have to live it. Establish a set of principles to guide you through tough decisions, and develop the courage to make those decisions and accept the consequences. Enhance your credibility by developing a track record of making and meeting commitments.

Teams voluntarily follow leaders because of their innate authority, not their formal authority, so figure out how to connect with your team on an emotional level. Be willing to tackle tough problems, make hard calls and accept stretch goals. You and your team will occasionally fail, so be willing to accept responsibility, recover and learn from your mistakes.

Beware that as a leader, you are on stage. Your teams will learn how to behave from your example, particularly during tough times. You set the tone for your organization's culture and values, so make sure you model the behaviors you want to see in your people.

Think of yourself as a business person. Good CIOs don't run technology shops; they run businesses. The best serve as key members of the executive team running their firm's core business. To be credible within the IT group, you must have a good grasp of technology, and you will be most effective if you have actually done some IT jobs. The same is true with the business community. If you don't have a business background, going back to school for an MBA will help, but running with the business units will be at least as valuable. Learn their language. Understand their strategies. Figure out what they are worried about and where they see opportunity, then develop ways to use technology to help them out.

Get intimate with the numbers. The lan-

WHEN OPPORTUNITY KNOCKS

Be the right person. Not every IT person is cut out to be a CIO. There are a variety of requirements beyond technical, project management and communication skills. If you look for opportunities that align with your personality, interests and other traits, you'll find success. These traits will help you stay on track:

- Pick a company for which it is critical to have a CIO.
- Look for projects that result in business improvement.

Be willing to learn quickly, and just as quickly, let go of old ways.

Realize that bigger companies will likely give you experience faster than smaller companies. A mid-sized corporation probably has a CIO position at a much lower level than a Fortune 500 company. If you're thinking you like, say, working with something you like, but not doing many things you don't, it's doing hard there that strong leadership is crucial needed. The best opportunity could be to step right where you are and build a better future.

Show that you can be successful in a variety of arenas. By building a team of diverse professional experience, complement different areas of expertise, such as computer operations and, ideally, some business functions.

—John Parker

don't understand how money is made and spent in your company, you won't make it to the CIO level. To effectively communicate with your CEO, board of directors, executive committee and chief financial officer, you must know what drives your company's costs and how to manage them. As a service provider within your organization, in order to be successful, you'll need to understand not only the IT budget, but also every business unit's budget.

Finally, remember the old adage, "Be careful what you wish for, because you might get it." Becoming a CIO can be an extremely rewarding opportunity for the person who is ready. But someone who hasn't prepared himself can feel like a dog who finally catches that truck he's been chasing — only to get run over by it. Do all you can to get ready for the role, and then enjoy. I can promise you it won't be boring. Good luck. © 8/999

Career Watch

ASK A PREMIER 100 LEADER

John Bartlett

Vice president of application development and quality assurance

Q&A

E. MATTAY
Ameritrade
Holding
Corp., Columbia, Md.

Bartlett is this month's guest Premier 100 IT Leader, answering readers' questions about QA vs. development work and finding an entry-level job in IT. If you have a question for one of our Premier 100 IT Leaders, send it to cmwqa@computerworld.com and watch for this column each month.

Is there more of an opportunity for career growth in quality assurance or software development? What are the future prospects for a quality assurance position? I will make two assumptions: that you are already in the technology field and that you realize that the software developer and quality assurance engineer roles are very different. In fact, I believe that they require very different characteristics. I urge you to consider whether you have a passion for one role or the other.

I believe that the prospects for QA professionals are very good. According to statistics released in 2002 by the National Research Council, U.S. companies spent \$75 billion in 2001 to repair damage caused by software defects. Companies are realizing that an investment in quality assurance will have a measurable impact on the bottom line. As a result, I see many enlightened companies investing in training for quality assurance engineers, in tools and hardware environments. It's an exciting and satisfying time to be a QA professional.

I just graduated with my bachelor's degree in computer engineering technology. I have very little experience in the field. Where should I go to have the best chance at an entry-level IT job? There are several approaches to take when seeking your first job in a particular field. Many universities offer job placement counseling, since they are familiar with the professional firms in the area. I'd encourage you to explore that option.

Second, don't undersell yourself as you craft your résumé and begin the interview process. Many employers are looking for intelligent candidates who have shown initiative and are a good fit with the culture. Consider how to leverage project assignments you've done as part of your course work. Convey the unique qualities that will make you a likely long-term contributor to future employers. And finally, network. Talk to friends and fellow graduates, and attend job fairs. Most employers realize that the best candidates come by way of referrals from their current employees. ☐ **51864**

Job Market Roundup

THE STATE OF THE IT JOB MARKET MAY DEPEND ON WHOM YOU ASK

As the new year began, contradictory assessments of the market were issued from various quarters. Most were at least partially positive outlooks, but that hardly added up to unanimity.

Janco Associates Inc. in Park City, Utah, last month released its 2005 Comparative IT Salary Survey, saying that there was a small decrease in demand for technology professionals and a drop of just under 1% in mean total compensation during the last six months of 2004, despite increased spending in many segments of the market. It also said that the outsourcing of IT jobs continues to have a negative effect on the U.S. and Canadian job markets. The two countries covered in the study concerned CIOs, especially those at large companies. Their mean compensation rose by more than 4% during the period studied.

Also last month, staffing firm Robert Half Global Resources reported that its index of job confidence among IT workers rose by 6.9 points in December to 116.3, an increase fueled by workers' belief that things are up and layoffs are declining.

IS THAT CONFIDENCE WELL-FOUNDED?

The U.S. Department of Labor reported that in December, the U.S. economy added 9,700 payroll jobs in the area of computer systems design and related services, bringing the total to 116 million. Jobs in this field have been

on the rise since April and are up by 75,300 positions since December 2003. And employment services firm Challenger, Gray & Christmas Inc. said that U.S. companies last year laid off 23% fewer workers than they did in 2003 and 62% fewer than in 2002. Nonetheless, Challenger also found that employment in the high tech industry is still in flux with job losses in the industry totaling 106,103 in 2004 and accounting for 17% of all job cuts.

SO, WHAT'S IN STORE?

One forecast comes from Robert Half Technology. Its 2005 Salary Guide (QuickLink 5676) predicts that average base pay for IT professionals overall will rise 6.5% this year. But certain positions will see greater-than-average increases. Leading that group (see chart below) are systems auditors, whose base compensation Robert Half expects to increase by 5%. In 2005, to the range of \$63,250 to \$81,750 annually. Systems auditors assess and document the capabilities of existing systems in advance of hardware and software upgrades, and demand for them is being driven by the need to comply with the Sarbanes-Oxley Act, the Gramm-Leach-Bliley Act and other regulations. According to the Robert Half Technology IT Hiring Index and Skills Report, 15% of executives polled plan to add IT staff early this year, while 20% anticipate cutbacks. The net 9% hiring increase is up three percentage points from the previous quarter's forecast and six percentage points from the year-end projection.

~ Jamie Eakin

Projected Fastest-Growing IT Salaries in the U.S., 2005

	2005	%
Systems auditor	\$63,250-\$81,750	5.5%
Pre- and postsales consultant	\$51,500-\$78,250	3.9%
Programmer/analyst	\$52,500-\$83,250	3.8%
Instructor/trainer	\$43,250-\$65,500	2.9%
Network security administrator	\$63,750-\$90,500	2.7%
Data security analyst	\$68,250-\$93,000	2.2%
Quality assurance/testing manager	\$66,750-\$86,750	2.2%
Disaster recovery specialist	\$60,500-\$90,750	2.2%
Internet/intranet developer	\$51,750-\$74,250	2.0%
Business systems analyst	\$56,000-\$80,500	1.9%

PAUL GLEN

Workplace Obligations

WOULDN'T IT BE NICE if every boss came with a standard API?

It would be so easy to look at the interface specifications and know exactly what he expected, in what format he expected it, when you should deliver it, what predictable events would result from your input and

how you should handle error conditions. All the politeness would go away. Those pesky emotions would become a nonissue. Success would become deterministic.

Sadly, it will never be so simple. Every boss-subordinate connection is a custom job. This is both the promise and the pain of workplace relationships; they are cobbled together not of hardware or software, but of wertware (the gray, squishy stuff between our ears).

The complaints about this are endless from the subordinate side. "I don't know what he wants, and he won't tell me." "She doesn't really understand what I do, so she can't tell me what she expects." "He tells me one thing, and then when I give it to him, he changes his mind." "She says that I have an attitude problem, but I don't really know what that means."

As it turns out, the inability to forge easily understandable, straightforward, repeatable relationships is just as frustrating for bosses as it is for subordinates. Supervisors would love to be able to clearly articulate exactly what they expect so that all their people would understand. Sadly, many managers erroneously believe that they have clearly defined and communicated their expec-

tations, and they just can't figure out why no one else seems to get their vision.

I've developed a rather simple philosophy of boss-subordinate relationships. Although not a detailed specification, it has served me well both as a manager and as a subordinate. It comes in two parts.

Part 1. A subordinate owes the boss and the organization three simple things:

- **Candor**
- **Loyalty**
- **Delivery**

That's it. If I deliver on all three of those things,

I can look myself in the mirror and feel that I've fulfilled my part of the employment bargain. Let's take a quick look at each one, because they are deceptively simple.

Candor. We owe the boss honest opinions about important things on the job. As knowledge workers, we are not hired for our muscle power; we are hired for our brain power, so we owe it to the boss to share the fruits of our thought. That doesn't mean that we blather on about every fleeting neural discharge, but if something is important, we need to share our perspective.

Sometimes, this can be an unpleasant obligation. Disagreeing with the boss is not always fun. Some managers are

not open to other people's opinions. Some are too insecure to accept them. Some believe that power confers wisdom and that they don't need to listen to anyone else. But the boss's receptiveness doesn't affect the obligation. If a project is running aground, someone has to speak up before it's too late.

Loyalty. I'm not talking about the blind fealty of a medieval vassal to his master, but rather a reasonable modicum of this uncommon virtue.

Ultimately, part of every manager's job is to make decisions. This includes making hard choices that may upset people. If a manager never ticks anyone off, he is probably shirking his responsibilities. If we have shared our opinions with our manager and he makes a decision we don't agree with, we are obliged to get over it and implement his choice. We should not spend endless hours trying to change things post hoc or, worse, trying to secretly undermine the decision.

Of course, there are exceptions to the loyalty rule. If what the boss has asked us to do is unethical, illegal, dangerous or patently self-serving, loyalty ends there.

Delivery. And finally, when we promise to do something, we do it.

Part 2. Bosses owe their subordinates three simple things too:

- **Candor**
- **Loyalty**
- **Delivery**

Although not a detailed API, this simple understanding can go a long way toward smoothing relationships and directing successful careers. What we owe one another in the workplace may be vast, but in some ways it is quite simple. ■ **62053**

U.S. AIR FORCE COLLEGE Senior Systems Professor of Instructional Design. The U.S. Air Force College seeks a Veteran instructional designer for the academic year 05-06. The successful candidate will be responsible for the primary development of instructional material for the delivery of the primary assignment of personnel assigned to the federal government and state and local governments.

In this position, the candidate will be responsible for designing/delivering innovative study strategies, procedures, applications, and systems to support the delivery of educational programs. The instructional design process will be used to analyze educational concepts and technology and act as an advocate and promoter for educational technologies and innovation to enhance education, promote the use of the most current educational technologies, research, and related instructional methodologies. Faculty demonstrate ability to produce, evaluate, and disseminate research results in the field of educational methodologies and technologies in order to provide faculty development and support to the institution in a graduate level education program. The appointment will serve in the Department of Instructional Education on the faculty of the U.S. Air Force College of Education and Graduate Learning. An award is increment in a classroom or technology field of study with experience in teaching and research in the field of education. The term of service which begins 1 August 05 for one year. Applications should submit a letter of interest to Dr. Captain Chon, Director of Academic Affairs, U.S. Air Force College of Education, ATTN: ATHC-ADE, 122 Forbes Avenue, Captain PA1913-5260, or email to captain.chon@usairforce.edu. For confidential applications, please mail to Captain PA1913-5260. All applications must be postmarked by 15 March 05.

Satellite Systems, Inc. has an immediate opportunity at their office in UT.

Analyst, Data Use engineering technology knowledge to support the development of system architecture, planning, coordinating and administering the implementation of distributed administration and management systems. Develop, refine, and maintain distributed architecture, data management, long range strategic planning, and system protection. Ensure the technical and operational integrity of data in management systems. Refine and validate system software as required. Provide engineering oversight to install and maintain distributed systems for large databases. Prepare technical assessments on existing and proposed system architectures, processes, and standards resulting in data management system recommendations. Knowledge of DB2, Oracle, SQL server, developer environments and distributed systems required. Minimum 5 years with the company's clients. BS in Computer Science, CIS, CS, CE, MIS, or MIS. Physics, Business or related degree preferred. Minimum 2 years Database Administrator, Data Base Developer or Senior Computer Analyst experience. Must have valid nonrestrictive license to practice as a consulting engineer in CA or licensing your return to practicing. CTRP, Certified Telecommunications Systems, Inc. Attn: Corporate Communications, 2007 Brundage Parkway, Suite 100, Menlo Park, CA 94025 EOE.

Thomson, Inc. is seeking a Manager of Technical Support.

The Manager of Technical Support is responsible for the management of Digital Satellite Systems development, troubleshoot and administer critical satellite resources, conduct various analyses to type requirements, and develop performance requirements for implemented systems. Responsible for maintaining and supply repair parts for equipment that have been designed or acquired in Electrical Engineering, Electronics Engineering, Electrical Engineering that is areas of programming experience, and other areas of communications engineering. To be of Manager's discretion to assign and direct work to a Researcher's office, or to assign a Researcher's office to another Researcher's office. Electrical Engineering plus 5 years of programming and communications engineering. Previous communication experience with satellite and remote sensing in HAM, Joe J. or Jim Thompson, Manager of Technical Support, 2007 Brundage, Suite 100, Menlo Park, CA 94025.

SENIOR BUSINESS SYSTEMS ANALYST (IT)

Government Electronics Corporation (GEC) is seeking a Senior Business Analyst (IT).

Works with customers to define business needs and technical requirements to produce software that fits business and technical needs. Manages the life cycle to ensure the business needs are met. Coordinates with business partners, management, project manager, and IT department to plan and execute projects. By identifying business needs and requirements in order to set and meet the needs of the customer.

Performs vendor selection, procurement, and contract negotiations.

Manages the life cycle of a project or its component in Computer

Systems, Electrical Engineering, or Management Information Systems work experience including 5 years of experience with open source software.

Ray's Return

RAY NOORDA IS BACK. On Dec. 17, the man who built Novell fired his trusted protégé, Ralph Yarro, for pocketing upward of \$20 million from "self-dealing transactions" at Noorda's investment company, The Canopy Group. Noorda replaced Yarro and took control again of the venture capital firm he founded and funded.

Think this is some obscure industry sideshow? Think again. Yarro was the architect of The SCO Group's assault on Linux and its corporate users. Yarro used his position to turn a Noorda-funded Linux start-up named Caldera into the anti-Linux litigation machine SCO.

But now Ray is back, and Yarro is gone. And that means . . . what?

For Noorda, it means a return to the spotlight. Until the mid-1990s, he was a true IT industry heavyweight, the man who grew Novell from a little Utah company into a powerhouse. Novell's NetWare was the LAN operating system that helped PCs gain a foothold in corporate IT.

Then Noorda decided to go after Macrosft head-on. As Novell CEO, he bought Unix from AT&T and added WordPerfect and Quattro Pro to compete with Word and Excel. That made Novell's board nervous, and it pushed the aggressive Noorda out in 1994. He was 70.

He didn't exactly slow down. Noorda had already earmarked his billion-dollar fortune for charity after he died. He became a venture capitalist to make the pile even bigger. His investments in Utah high-tech start-ups did well. One of those bets was on Linux in 1995, when a Novoda start-up called Caldera launched an early commercial Linux distribution.

And in 1996, Noorda bankrolled a lawsuit accusing Microsoft of unfair competition against an MS-DOS competitor named DR-DOS. Microsoft eventually paid \$275 million to settle the case.

Finally, in 1998, Noorda stepped away, handing over day-to-day control of Canopy to Yarro. That's when things got ugly.

According to a lawsuit filed by Novoda and Canopy in January, Noorda trusted Yarro to do what was right for Canopy, and the charities it would someday feed. Instead, over the next six years, Yarro granted Linux, IBM and two other entities most of Canopy's stock, along with more than \$20 million in allegedly im-

proper bonuses and more than \$100 million in stock options. Noorda wants that money back.

Yarro has filed his own lawsuit, claiming that by 2003 Noorda's memory and health were bad and he "became incapacitated and/or subject to undue influences." He says Noorda was manipulated into firing him by Yarro's rivals, including Noorda's daughter, Yarro and his associates want their jobs back, plus \$100 million, and they want Noorda kicked off his own board.

But for now, Yarro's the one who's out at Canopy. He's still SCO Group chairman, but that may last only until Canopy offers a new slate of directors.

What about Noorda? Is he really out of it? That's tough to buy. It was just a few years ago that a Computerworld reporter caught up with Noorda, hoping to get a comment on Microsoft's antitrust troubles. She didn't get the quote. But when she mentioned in passing that he needed a new car, Noorda — who also owned a string of auto dealerships — was sharp enough to turn the interview into a sales pitch.

That's Ray: hardheaded, aggressive, cagey, his eye always on the customer.

So when he takes control of SCO's Linux litigation, we can be pretty sure one set of lawsuits will go away almost immediately: the ones aimed at corporate Linux users. At 80, Noorda may have lost a step. But he'll never be so far gone that he'll think it's a good idea to sue his own customers.

And the suits against Novell, Red Hat and IBM? For now, there's no telling. But if all hardheaded, aggressive, cagey Ray really is back, we'll soon find out. **52364**

Hard Problems, Easy Solutions

The classified research lab is essentially a steel vault with interlocking electric doors. "Power was lost one morning, the backup generator failed, and people in the lab were trapped in utter darkness for a long hour," says a plot fish there. An investigation reveals that the generator was never tested, so management moves quickly to make sure the incident is never repeated: "Within a week," fish reports, "every employee on the project was issued a glow-in-the-dark light stick."

Aha! Attorney calls his firm's help desk, complaining that the server isn't working on his PC. "He had gone into the volume pane at the bottom of his interface, and the volume was turned on," plot fish says. "I fished him through several more entries in the Control Panel for sound services. We finally got down to a setting called 'volume' . . . I asked him what that was set at. He said, 'Static percent or zero.' So you have speakers?"

By the Numbers
Support ticket Novell needs a part to be opened in a timely manner identified correctly. Broad. So he immediately tries to call Novell admiral to open Part 5495, https://not-going. "Just tell me: Part three, four, five, six, https://admiral. "Please ring 15 minutes later. Do you really want Parts 3, 4, 5 and 6 opened, and why? says Broadwell admiral.

Details, Details
Plot fish's company is bought by a much larger entity, and he figures it's a great opportunity — until the new boss speaks at an off-site meeting. "First he talked about how his company had 50 software developers when it was bought by the new parent firm," plot fish says. "Most of the speech was about how they were going to eliminate the company to make it more competitive. At the end of his speech, he casually mentioned how they only have five software developers left doing prototyping work, and

WYSIWYG

Now our servers are losing their password but can't log in. "I try her computer and log right in, so I ask her to try again," support plot fish says. "Then I notice that as she says each letter, she's hitting the asterisk key. Turns out she watched other people log in and could only see stars, so that's what she tried over and over."

FRANK HAYES ■ FRANKLY SPEAKING

Ray's Return

RAY NOORDA IS BACK. On Dec. 17, the man who built Novell fired his trusted protégé, Ralph Yarro, for pocketing upward of \$20 million from "self-dealing transactions" at Noorda's investment company, The Canopy Group. Noorda replaced Yarro and took control again of the venture capital firm he founded and funded.

Think this is some obscure industry sideshow? Think again. Yarro was the architect of The SCO Group's assault on Linux and its corporate users. Yarro used his position to turn a Noorda-funded Linux start-up named Caldera into the anti-Linux litigation machine SCO.

But now Ray is back, and Yarro is gone. And that means . . . what?

For Noorda, it means a return to the spotlight. Until the mid-1990s, he was a true IT industry heavyweight, the man who grew Novell from a little Utah company into a powerhouse. Novell's NetWare was the LAN operating system that helped PCs gain a foothold in corporate IT.

Then Noorda decided to go after Microsoft head-on. As Novell CEO, he bought Unix from AT&T and added WordPerfect and Quattro Pro to compete with Word and Excel. That made Novell's board nervous, and it pushed the aggressive Noorda out in 1994. He was 70.

He didn't exactly slow down. Noorda had already earmarked his billion-dollar fortune for charity after he died. He became a venture capitalist to make the pile even bigger. His investments in Utah high-tech start-ups did well. One of those bets was on Linux in 1995, when a Noorda start-up called Caldera launched an early commercial Linux distribution.

And in 1996, Noorda bankrolled a lawsuit accusing Microsoft of unfair competition against an MS-DOS competitor named DR-DOS. Microsoft eventually paid \$275 million to settle the case.

Finally, in 1998, Noorda stepped away, handing over day-to-day control of Canopy to Yarro. That's when things got ugly.

According to a lawsuit filed by Noorda and Canopy in January, Noorda trusted Yarro to do what was right for Canopy and the charities it would someday feed. Instead, over the next six years, Yarro granted himself and two associates most of Canopy's stock, along with more than \$20 million in allegedly im-

proper bonuses and more than \$100 million in stock options. Noorda wants that money back.

Yarro has filed his own lawsuit, claiming that by 2003 Noorda's memory and health were bad and he "became incapacitated and/or subject to undue influences." He says Noorda was manipulated into firing him by Yarro's rivals, including Noorda's daughter. Yarro and his associates want their jobs back, plus \$300 million, and they want Noorda kicked off his own board.

But for now, Yarro's the one who's out at Canopy. He's still SCO Group chairman, but that may last only until Canopy offers a new slate of directors.

What about Noorda? Is he really out of it? That's tough to buy. It was just a few years ago that a Computerworld reporter caught up with Noorda, hoping to get a comment on Microsoft's antitrust troubles. She didn't get the quote. But when she mentioned in passing that she needed a new car, Noorda — who also owned a string of auto dealerships — was sharp enough to turn the interview into a sales pitch.

That's Ray: hardheaded, aggressive, cagey, his eye always on the customer.

So when he takes control of SCO's Linux litigation, we can be pretty sure one set of lawsuits will go away almost immediately: the ones aimed at corporate Linux users. At 80, Noorda may have lost a step, but he'll never be so far gone that he'll think it's a good idea to sue his own customers.

And the suits against Novell, Red Hat and IBM? For now, there's no telling. But if old hardheaded, aggressive, cagey Ray really is back, we'll soon find out. © 52364

THE BRAINS TO BACK IT UP.

All sort of products claim to reduce the complexity and cost of enterprise backup. But one actually delivers—the Scalar[®] i2000, part of the growing iPlatform™ family from ADIC, the leading provider of tape libraries for open systems backup.[™]

Embedded intelligence makes Scalar i2000 tape libraries intelligent. Intelligent enough to handle 9.6 Gbytes per library. Intelligent enough to support up to 16 tape drives per library. Intelligent enough to support up to 16 tape drives per library.

Faster resolution, fewer service calls. With intelligent diagnostics, Scalar i2000 tape libraries can self-diagnose and resolve errors faster than ever before. And with built-in support for up to 16 users, Scalar i2000 tape libraries can support more users than ever before.

Capacity on demand. A single Scalar i2000 tape library can store up to 2000 Gbytes of data. And with optional tape cartridges, you can add capacity as needed.

After all, you were hired to use your brains for more important things.

SCALAR[®] i2000
